| South Africa | zaf |

ABSTRACT

This dataset is a national spatial data product derived from South Africa's Census 2022 and designed to support the analysis of population and household characteristics within service delivery and administrative reporting districts created by StatsSA. Released by StatsSA as the Census 2022 Special District Layer Product, the dataset provides spatial boundary files and geographic codes for administrative and service delivery districts used for planning and reporting in South Africa. Administrative and service delivery districts are education districts, health districts, magisterial districts (and their sub-magisterial divisions), and police districts. The purpose of providing data at these levels is to enable the integration of official Census 2022 data with operational planning geographies used by public institutions, thereby improving evidence-based planning, service targeting, and interdepartmental comparisons.

The dataset includes data on demographic distribution, household composition, social conditions, and the spatial allocation of public services. The primary reasons for producing district-level data were:
to make the Census 2022 results usable within real-world service delivery situations
to reveal how population and household patterns differ across districts
to enable Census data to better inform planning, policy formulation, and resource allocation and monitoring.

KIND OF DATA
Census/enumeration data [cen]

UNIT OF ANALYSIS
Households and individuals

Version

VERSION DESCRIPTION
v1.1: Edited, anonymised data for public distribution

VERSION DATE
2026-04-01

Scope

NOTES

Because the COVID-19 pandemic affected key phases of geography frame finalisation and data collection of the census, a multi-mode data collection approach was adopted. Three methods of data collection were used in this census, namely: face to face computer assisted personal interview (CAPI); computer assisted telephone interview (CATI); and computer-assisted web interview (CAWI).

KEYWORDS

| Keyword |
|-----------------------------|
| Statistics South Africa |
| Census 2022 |
| Spatial boundary data |
| GIS shapefiles |
| Census geography |
| Administrative districts |
| Service provision districts |

Coverage

GEOGRAPHIC COVERAGE

The geographic scope of the data is national coverage

GEOGRAPHIC UNIT

The lowest level of geographic aggregation of the data is administrative and service delivery district

UNIVERSE

South African Census 2022 covered every person present in South Africa on the Census reference night, midnight of 2-3 February 2022 including all de jure household members and residents of institutions.

| Statistics South Africa | Government of South Africa |

Sampling

RESPONSE RATE

Coverage errors are a measure of how many persons or households were missed or counted more than once in the census. The final net coverage error rate relative to the final true population of 61,4 million persons is 31,1%. The final net coverage error rate relative to the final true population of 19,3 million households is 30,5%.

Data Collection

Data Processing

DATA EDITING

DataFirst prepared the Census Administrative & Service Provision District Profiles 2022 tables downloaded from Stats SA's website and standardised the file names so that each data file could be easily identified and managed. Using R, DataFirst linked each Excel table to the corresponding official district boundary shapefile and appended higher-level geographic identifiers, such as district municipality and province, to every record. As part of this step, district names were standardised to ensure consistent matching across files, unnecessary columns with total were removed, and the revised tables were written back to Excel. DataFirst then used Stata to import the cleaned tables, assign consistent and self-explanatory variable names, apply descriptive variable labels, and save the final datasets. The accompanying R script documents the geographic matching and enrichment process, while the Stata do-file documents the variable renaming and labelling process.

Data Appraisal

ESTIMATES OF SAMPLING ERROR

Content errors indicate the quality of key characteristics in the census. With respect to content errors, six variables were tested for consistency in terms of the responses that were recorded in the Census and the Post-enumeration Survey (PES) 2022. The aggregated index of inconsistency was 7,5% for population group, 8,2% for sex, and 13,6% for age group, indicating a high level of agreement. The aggregated index of inconsistency for marital status was 23,0%, relationship to head of household was 34,8%, and country of birth was 42,3%, indicating moderate rates of agreement.
