
Revised estimates
Labour Force Survey
September 2000

The Labour Force Survey (LFS) 2000:2 data is in three files. The files are ASCII, fixed field, with one line of given length per record. This format was chosen so as to make the data usable with as many statistical programs as possible, and thus accessible to as wide a range of people as possible.

Other important information for users is found in the:

- ◆ Questionnaire
- ◆ Additional code lists (occupation, industry, education)
- ◆ Relevant publications
- ◆ Web-site (<http://www.statssa.gov.za/>)

Field Code Changed

THE DATA FILES

The files and the corresponding sections of the questionnaire are as follows:

- PERSON:** Data from Flap, Sections 1 and 6
- WORKER:** Data from Sections 2, 3, 4 and 5
- HOUSE:** Household variables: data mainly from Section 7.
- STRATUM_PSU:** Stratum and PSU numbers

The files also contain some derived variables.

The information in each file contains the following:

- Nature of records in the file and population covered
- Description of variables

In addition the file **STRATUM_PSU**, containing stratum and primary sampling unit (PSU) numbers for each record, is supplied to enable researchers to do complex sample analyses on the data.

Description of variables

The description of the variable comprises the following information:

Descriptive name: This is a short English description plus the (usually eight-character) variable name in the original file used by Stats SA to construct the ASCII file.

Position of the variable: The position of the data within the record, recorded in the format (@xxx y). “@xxx” indicates that the data begins at position (i.e. column) xxx and “y” indicates that it is y digits wide. A “y.d” format, as used for the weights, is “y” digits wide with “d” decimal places. All data is numeric. All data is thus right-justified.

Source: This is either the question in the questionnaire or, for derived variables, the method of derivation. Derived variables are usually found towards the end of a record.

Valid range: The range of valid values for the variable. For continuous variables this reflects the upper and lower limits as found in the data.

Not applicable: The code for not applicable is provided for each variable. These are now numeric.

Missing value: A code for “missing”/unspecified values is given for each variable.

Notes: Specific observations to be noted by users.

Most questions in the Labour Force Survey questionnaire are pre-coded, i.e. there is a set number of choices from which one or more must be selected. For open-ended ‘write-in’ questions, the description will note that post-coding occurred and explain how this was done. For most variables the coding is apparent from the questionnaire (available elsewhere in the documentation) and is not repeated in the variable description. Where the coding is not apparent, the description either provides the codes or indicates where code lists are to be found.

Linking files

The data from the four different files can be linked on the basis of a record identifier. The record identifier is the first field/s in each file. Each record contains a unique number (UqNr), position 1 to 13, which constitutes a household identifier. All records with a given household identifier, no matter which file they are in, belong to the same household. For individuals, a further two digits, position 14 and 15, constitute the Person number (PersonNr). When these are added to the household identifier, a unique individual identifier is created. Again, these can be used to link records from the PERSON and WORKER files.

Please Note: The unique numbers (UqNr) of 127 records in the PERSON file do not appear in the HOUSE file.

THE SAMPLING AND ESTIMATION PROCEDURE

Before the release of Census 2001 results, the LFS datasets were weighted based on census 1996 information. After the release of the 2001 Census it was imperative that all previous LFS datasets be re-weighted to the most recent census results to allow for better comparisons.

During survey field operations, some of the sampled elements do not respond as expected. Non-response can take different forms, like non-contact, refusal, unreliable information, etc. This kind of non-response is termed unit non-response. Sometimes respondents do not respond to some of the questions. This kind of non-response is termed item non-response. These kinds of non-response have negative effects on the estimates, thus it is necessary to account for them. For unit non-response, the sampling weights are adjusted.

The sampling procedure for the LFS was a two-stage complex sample. The first stage was the selection with probability proportional to size of PSUs from the 1996 Census list of Enumerator Areas (EAs), to form the Master Sample of 1999. The 1999 Master Sample is thus based on the 1996 Population Census list of EAs and the measure of size used was the number of dwelling units per PSU. The second stage involved the systematic selection of 10 dwelling units from each of the selected PSUs. The Master Sample was stratified into 18 strata, i.e. 9 provinces and within each province by urban / non-urban.

Calculation of the selection probabilities

The PSU selection probability is given by,

$$P_{PSU} = \frac{n_{PSU}}{N_{PSU}} . n_s$$

where n_{PSU} is the number of households constituting the selected PSU during census fieldwork, n_s is the number of responding PSUs per stratum, and N_{PSU} is the number of households constituting the particular stratum during census fieldwork.

The household inclusion probability per PSU is given by

$$P_{HH} = \frac{n_{HH}}{H_{HH}},$$

where n_{HH} is the number of selected dwelling units per PSU, H_{HH} is the number of dwelling units in the PSU in question at a particular time different from the census time.

The household weight adjusted for non-response is given by

$$\frac{1}{P_{HH} \cdot r_{HH}}$$

where r_{HH} is the response rate and is given by $r_{HH} = \frac{n_{RESP}}{n_t}$ where n_{RESP} is the number of responding households and n_t is the total number of households (i.e. excluding listing errors, vacant dwelling units, demolished dwelling units, etc) in the sample per PSU.

The adjusted sample weights are then given by

$$W_{HH} = \frac{1}{P_{PSU} \cdot P_{HH} \cdot r_{HH}}$$

The adjusted weights are then post-stratified by age, gender, and age group using the SAS macro, CALMAR.

Note: To get to know in detail the fundamental maths of CALMAR it is suggested that the following article and the references therein be consulted:

DATA FILE: STRATUM_PSU

The LFS' is based on multistage stratified cluster sample (i.e. complex samples). The sampling population is first stratified into explicit strata, then pre-specified numbers of primary sampling units (i.e. PSU's) are drawn in the strata, whereupon a fixed number of households are drawn in each drawn PSU's. The consequence of this is that statistical techniques of analysis based on a simple random sample design will give liberal (i.e. too significant) results. This is the case with most generally available statistical software packages. However, dedicate software is available which takes the complexity of the of the sample design into consideration and which requires stratum and PSU numbers. The STRATUM_PSU data file is supplied for this type of analysis and can be merged with any of the other three data files i.e. PERSON, WORKER and HOUSE by the variable unique number (UqNr), position 1 to 13.

This file contains stratum and PSU numbers.

Unique number (UqNr) (@1 13.)

Unique household identifier

Note: This is the unique household identifier which can be used to link data from this file with data for the same household from other files.

Stratum number (Stratum) (@14 2.)

PSU number (PSU) (@16 3.)

Please Note: To get rid of non-existing stratum numbers all records with invalid weights should be deleted after merging
