SERIES INFORMATION

Statistics South Africa. Labour Force Survey: September 2007. [dataset]. Version 2.1. Pretoria: Statistics South Africa [producer], 2008. Cape Town: DataFirst [distributor], 2011. DOI: <https://doi.org/10.25828/s06m-8735>

ABSTRACT

The LFS is a twice-yearly rotating panel household survey, specifically designed to measure the dynamics of employment and unemployment in South Africa. It measures a variety of issues related to the labour market, including unemployment rates (official and expanded), according to standard definitions of the International Labour Organisation (ILO).

All editions of the LFS have been updated (some more than once) since their release. These version changes are detailed in a document available from DataFirst (in the "external documents" section titled "LFS 2000-2008 Collated Version Notes on the South African LFS").

VERSION NOTES

The South African September 2007 LFS dataset was originally released in March 2007 as 2 data files (person and worker), before being immediately retracted due to a number of errors identified by Statistics South Africa. A second version was made available shortly thereafter by Statistics South Africa (version 2.0). A third version was then downloaded by DataFirst in November 2009. This version (version 2.1), the worker data file in particular, differs from version 2.0.

Specifically, the variable "Q31inHHP" (which is a categorical reflecting whether or not the respondent is supported by members of his or her household) differs substantively between versions. In version 2.0, the data shows roughly 13,388 observations responding "No" (a value of 2) and roughly 26,287 assigned the value label "N/A" (data value of 8). This reverses in version 2.1, with 26,287 respondents now listed as "No" and 13,388 listed as "3" for that variable. The value labels of "N/A" and "Unspecified" are no longer in the data file and the actual data values have also changed to 3 and 4. It is assumed that the value 9, previously labelled as "Unspecified", is now simply equivalent to the unlabelled data value "4" (which is no longer labelled at all). This is assumed because the count of observations of that value is the same between

versions of the data file, although this may be false given that the observation count reverses for two other values in the same variable. The original metadata specifies that data values of 8 and 9 should be labelled "N/A" and "Unspecified" respectively. The change in the data between versions, then, looks likely to be an error of some kind.

A third version was downloaded by DataFirst in August 2011, which is the same as version 2.1.

UNIVERSE

The LFS sample covers the non-institutional population except for workers' hostels. However, persons living in private dwelling units within institutions are also enumerated. For example, within a school compound, one would enumerate the schoolmaster's house and teachers' accommodation because these are private dwellings. Students living in a dormitory on the school compound would, however, be excluded.

Sampling

SAMPLING PROCEDURE

Statistics South Africa uses a rotating panel methodology for the labour force survey. The rotating panel methodology involves visiting the same dwelling units on a number of occasions (in this instance, five at most). After the panel is established, a proportion of the dwelling units is replaced each round (in this instance, 20%). New dwelling units are added to the sample to replace those that are taken out.

Enumeration Areas (EAs) that had a household count of less than twenty-five were omitted from the census 2001 frame that was used to draw the sample of Primary Sampling Units (PSUs) for the new Master Sample. Other omissions from the Master Sample frame included all institution EAs except workers, hostels, convents and monasteries. EAs from census 2001 were pooled in two stages, before and after sampling. Before sampling the criterion that was used to pool EAs was that they should contain a minimum of one hundred households. However, during listing it was discovered that there were discrepancies between the information on the database and what was on the ground.

Therefore, in the second stage of pooling, EAs that were found to have less than sixty dwelling units during listing were pooled. The Master Sample is a multi-stage stratified sample. The overall sample size of PSUs was 3000. The explicit strata were the 53 district councils/metros (DCs). The 3000 PSUs were allocated to these DCs using the power allocation method. The PSUs were then sampled using probability proportional to size principles. The measure of size used was the number of households in a PSU as calculated in the census. The sampled PSUs were listed with the dwelling unit as the listing unit. From these listings systematic samples of dwelling units per PSU were drawn. These samples of dwelling units form clusters. The size of the clusters differs depending on the specific survey requirements. The LFS uses one of the clusters that contain ten dwelling units.

WEIGHTING

The initial weights (household weights), based on the sample design, were equal to the inverse of the probability of selection. The initial weight for each member of the household was the same as the weight for the household itself. Further adjustment factors were then calculated within PSUs to account for non-response. To adjust for under-enumeration and to align survey estimates with independent population estimates, the weights were calibrated against Person benchmarks. A software package called CALMAR was used to perform this calibration. Using an iterative procedure, CALMAR adjusted the weights so that Person estimates conformed as closely as possible to external Person benchmarks. Gender, race and age group parameters were used for the Person cross-classification of the population.

 Description This document summarises all differences between various editions of the LFS (2000-2008 - 16 datasets in total) discovered by DataFirst. The document may not be exhaustive as it is possible that certain differences have between versions been overlooked. Furthermore, DataFirst was only able to compare versions of the data that were available, either online or within the DataFirst archive, as of August 2011.

Calibrating StatsSA's National Household Survey weights to a consistent series over time

Title Calibrating StatsSA's National Household Survey weights to a consistent series over time
 Author(s) Nicola Branson
 Date 2010-01-01
 Country South Africa
 Language English

Description In this document the author provides details on a new set of survey weights which she created using entropy estimation to allow National Household Surveys produced by Statistics South Africa to be presented as a consistent series over time. These surveys include the October Household Survey, conducted from 1994-1999, the Labour Force Survey, initiated in 2000, and the General Household Survey undertaken from 2002. The data from these surveys is frequently stacked side-by-side to create time series data. The data is however, designed as cross sections with no emphasis on consistency in the series over time. As a result the series shows large fluctuations even at the aggregate level. In addition, until 2003, post-stratification was done at the person level which results in inconsistencies between the person and household files. The new set of weights are benchmarked to aggregate numbers from the ASSA AIDS model, e a series of mathematical models developed to assist the actuarial profession and the Actuarial Society of South Africa in assessing and addressing the impact of the AIDS epidemic in South Africa. They therefore present aggregates which are more consistent over time. In addition, these weights can be used at both the person and household level.

The new set of consistent cross-entropy weights and their supporting documentation and syntax files are publicly available with the Labour Force Survey 2007 September resources, under "Other Materials".
