STUDY DESCRIPTION

SADA 0130

TITLE: Internal migration in South Africa: 1999

PRINCIPAL INVESTIGATOR: University of Pretoria

DEPOSITOR: University of Pretoria

KEYWORDS: Internal migration; Population;

SUMMARY: The purpose of this project is threefold:
(a) To enhance expertise on migration of personnel in national and local/regional research and planning agencies. This is consistent with the goals of South Africa’s government to strengthen the domestic capacity to undertake research on population and its relation to the development process.
(b) To undertake field surveys that will provide both direct research experience for individual trainees and information on migration patterns and their causes and consequences. It is hoped that such information will allow better insights on migration as a process. In so, doing, it should provide a stronger basis for policy development and evaluation on the interrelations among population redistribution development, women’s status, health, and reproduction.
(c) To create the opportunity for comparative assessment of migration patterns and policies in the four countries in the UNFPA/Mellon Foundation project, in order to enhance our understanding of migration in these countries in particular and in developing countries generally.

IMPORTANT VARIABLES: Age, gender, levels of education and migration.

DEMOGRAPHIC VARIABLES: Age, gender, level of education, marital status, migration, use of health services, economic activity, unemployment, employment and self-employment.

UNIVERSE: Households in the nine provinces of South Africa

GEOGRAPHIC LOCATION: South Africa

METHOD OF DATA COLLECTION: Survey Questionnaire

UNITS OF OBSERVATION: Households

DATE OF DATA COLLECTION: September 1999 and March 2000

EXTENT OF DATA COLLECTION: 2 data files in SPSS and machine-readable documentation.
FILE SPECIFICATIONS:

**Part 1: SAMIG2002 (part 1) data**
Number of cases: 9 813
Number of records: 9 813
Number of records per case: 1
Number of variables: 956
Number of kilobytes: 10 298 KB

**Part 2: SAMIG2002 (part 2) data**
Number of cases: 2 252
Number of records: 2 252
Number of records per case: 1
Number of variables: 43
Number of kilobytes: 156

RESTRICTIONS:
None

DATE STUDY ADDED:
03 March, 2003
CHAPTER 1: INTRODUCTION
Sidney Goldstein

1.1 Migration patterns in South Africa

Worldwide, rapid social, economic, and political changes in developing countries have led to greater rural/urban and rural/rural migration, and widespread movement back and forth between current and former or usual places of residence. Especially in countries undergoing economic, social, and political transitions, it has become clear that migration has become a major response to such transitions and a major factor, in turn, in population change, urbanization, rural development, and modernization.

Like a number of other countries, South Africa is a society in transition. The changes are in large measure associated with the dismantling of apartheid and the move toward democracy since 1994. The abolition of the homelands and the pass system and the many other changes associated with the dismantling of apartheid and the reintegration of South Africa into the community of nations have led to changes in internal migration within the country itself. These developments argue strongly for fuller attention to the interrelations between migration and development, including the impact of movement on health, women's status, reproduction, and the patterns of racial distribution and interaction among the population. Such attention requires an increase in personnel (especially among non-whites) qualified to research the key issues and to provide input to policy. If effective programs designed to cope with extant problems are to be proposed, a basic need will be for more information on migration patterns.

The internal migration situation in South Africa seems to be different from that in most other African countries. This is because close to 65 percent of all South Africans already live in urban places. Although agriculture still plays an important role in the South African economy, only a small proportion of the population is dependent on agriculture for a living; industry has become the major source of income of employed South Africans. A high percent of those in the labor force ages are, in fact, unemployed.

One of the unique characteristics of internal migration in South Africa is the persistence and extent of short distance migration. Large numbers of black workers leave their families in rural areas while they work in cities. Most of the so-called "rural" households in South Africa are not dependent on farming any longer, but on the income of family members who are working in the
Large numbers of black workers commute on a weekly or monthly basis between the cities where they work and the rural villages where their families live. Many of them will likely retire to their home villages. However, as a result of the growing proportion of population in urban places, intra-urban and urban-urban migration is now becoming an important form of migration among the black population as it already had become among the whites and other minorities. Many blacks are now moving out of the congested townships and locating in “informal settlements” on the periphery of urban areas, creating serious problems for urban planners.

1.2 The need for surveys on migration

These patterns of redistribution are largely based on impressionistic observations and on small-scale studies across the country, rather than on national migration statistics. In 1999 when the current study was planned, no comprehensive study of internal migration had yet been completed in South Africa as a whole. The lack of any explicit questions on migration in either the 1985 or the 1991 censuses compounds this deficiency. The 1996 census did contain several questions on migration and the analysis of these data has begun to provide some insights into migration patterns in the country. Yet, little is known about the crucial years between 1980 and 1996 when momentous changes in black migration seem to have taken place, or about the more recent years following the 1996 census.

This lack of good migration data is a worldwide phenomenon. The International Conference on Population and Development, held in Cairo in September 1994, recognized, as have most governments in developing countries, that urbanization and the migration contributing to it are inevitable and irreversible processes; an integral part of economic and social development, mobility needs to be guided rather than obstructed (United Nations, The World Population Plan of Action, 1994 Report, 1995:77). Such guidance requires solid information on the current situation and on the linkages among the demographic, social, and economic factors underlying ongoing and future changes. The importance of migration and urban growth in recent years and the need for more information as a basis for more effective policy development is reflected most recently in the attention given these topics in Habitat II, held in June 1996 (United Nations, Second UN Conference on Human Settlements, 1996).
Despite the concerns expressed by governments and international conferences about the pace of rural-to-urban migration and urbanization in developing countries, efforts to guide these processes have been quite limited. When policies have, in fact, been adopted to guide population redistribution, few governments have been satisfied with the results. A United Nations survey indicates that only 27 percent of national governments consider their own national redistribution pattern as satisfactory, and as many as 45 percent thought that a major change in patterns is necessary (United Nations, National Population Policies, 1998). The basis for developing and adopting policies is unlikely to be sound since many countries know little about their own underlying processes of migration and urbanization. Indeed, many countries lack the expertise and the data necessary to undertake the research to assess migration and urbanization and to prepare policy guidelines that are more likely to be successful. Some have only recently begun to include questions on migration in their censuses and to give careful thought to the usefulness of their system for the classification of populations as rural or urban.

Confronted with this situation, social scientists and policy makers in a number of the countries experiencing increased rural-to-urban migration and large-scale temporary movement have become keenly aware of the need to undertake research on these important aspects of the dynamics of population change (United Nations, World Urbanization Prospects: The 1996 Revision, 1998). They recognize that migration can impinge directly and indirectly on the other features of population change. Understanding the causes and consequences of migration is essential to successful planning and policy development for both urbanization and rural development. In addition, migration is clearly implicated in changes in the infrastructure, environment, labor force, economic development, status of women, family structures and reproductive behavior; it also affects such basic needs as the provision of food, housing, education, health care, and access to family planning.

A critical need therefore exists for detailed demographic data on migration. Both at the national and the local levels, public sector institutions and private sector agencies are constantly in need of in depth reliable information on the current demographic situation and on changing patterns. Migration data in particular are urgently needed by many government departments (e.g., the departments of education, health, labor, land affairs, environmental affairs) as well as by urban and regional planners concerned with housing, racial integration, women’s status, land reform, provision of basic services, and the interrelations between migration on the one hand and fertility, health, and mortality on the other. Moreover, more attention needs to be given to other key variables, including separation of spouses as a result of migration, duration of residence, accessibility to family planning programs in origin and destination, and infant/child mortality. Only
through attention to the separate and joint effects of selectivity at origin, adaptation at
destination, and the disruptions engendered by the move itself, as well as the ways in which
these differ for permanent and temporary migrants, can the full impact of migration on fertility
and health be assessed. Inadequate attention to migration in the vast majority of Demographic
and Health Surveys precludes their use for such evaluation; their definition of migration in terms
of reliance on current residence in relation to place of birth or place of early socialization does not
allow meaningful assessment of the interaction between migration and reproductive behavior.
Particularly needed are data that allow the assessment of the role of migration in the
demographic transition in South Africa.

Crucial to such research is the availability of personnel with expertise in the measurement of
migration and evaluation of its relation to other demographic, social, and economic factors.
While many researchers have had experience working with fertility data, especially those of the
World Fertility Survey (WFS) and the more recent Demographic and Health Surveys (DHS), they
have not had comparable opportunities to collect or to analyze data on migration and
urbanization. Development of the critical capacities needed within individual countries to pursue
such research is therefore a key goal of this project.

To meet these data needs requires the training of planners and researchers in South Africa in the
procedures for collecting and analyzing information on migration and its relation to development,
women's status, health, and reproduction. In recognition of such needs among scholars and
government officials in a number of developing countries, many of them strongly encouraged us
to pursue our efforts to obtain funding to enhance training and research in migration that would
be useful for policy formulation and evaluation. Among these individuals was Professor Kobus
Oosthuizen, former Director of the Centre for Population Studies (CENPOPS), Pretoria University.

With his encouragement, as well as that of scholars and planners in a number of Asian, African,
and Latin American countries undergoing transitions, Dr. Sidney Goldstein, of the Population
Studies and Training Center (PSTC) of Brown University, contacted the United Nations Population
Fund (UNFPA) about the possibility of undertaking a series of comparative training and research
projects in several countries. In 1997, the UNFPA agreed to fund a training/research project in
three countries – Vietnam, Ethiopia, and Guatemala. Recognizing the importance of migration in
South Africa and the pressing need for increasing the number of qualified researchers capable of
focussing on this topic, in 1998, the Andrew W. Mellon Foundation provided additional funds to
add South Africa as a fourth country in the project. CENPOPS, at Pretoria University, was given
major responsibility for the project, working in cooperation with scholars from the PSTC at Brown University. The focus of the South African project was on the country's black population.

1.3 Purpose and format of the South African project

As originally envisioned, the purpose of this project is threefold:
(a) To enhance expertise on migration of personnel in national and local/regional research and planning agencies. This is consistent with the goals of South Africa’s government to strengthen the domestic capacity to undertake research on population and its relation to the development process.
(b) To undertake field surveys that will provide both direct research experience for individual trainees and information on migration patterns and their causes and consequences. It is hoped that such information will allow better insights on migration as a process. In so, doing, it should provide a stronger basis for policy development and evaluation on the interrelations among population redistribution development, women’s status, health, and reproduction.
(c) To create the opportunity for comparative assessment of migration patterns and policies in the four countries in the UNFPA/Mellon Foundation project, in order to enhance our understanding of migration in these countries in particular and in developing countries generally.

Consistent with these goals, the format of the project in each of the four countries, including South Africa, has followed parallel lines:

1.3.1 Planning Visit

Initially, representatives of the Population Studies and Training Center (PSTC) visited the country and met with representatives of CENPOPS to plan the training/research project design, schedule, and products. This visit also was used to sign an agreement outlining these components of the joint effort, the financial arrangements, and the commitments of all parties to the agreement. In South Africa, this visit to the Centre for Population Studies (CENPOPS) at the University of Pretoria took place January 15-31, 1999.
1.3.2 Training Workshop

Following the decision on which areas of the country were to be the sites of the survey (usually areas most affected by migration), CENPOPS selected the individuals from national and local/regional agencies and institutions who were to be trained and who were later to serve as supervisors of the field operations. Next, a two-week Training Workshop was held at the University of Pretoria in May 1999 for the 22 participants and a number of interested observers. In this Workshop, Professor Sidney Goldstein and Research Associate Alice Goldstein from PSTC at Brown University along with Professors Kobus Oosthuizen, Pieter Kok, and Johan van Zyl of CENPOPS as well as several guest lecturers, made presentations. The range of topics included theoretical, policy, methodological, and substantive issues related to migration. The work sessions included attention to what was known about the demographic history and current situation in South Africa, the modifications that needed to be made in the model questionnaires already developed for use in the surveys conducted in the other participating countries, and the sample design that would be most effective for coverage of migration in South Africa.

Overall, the workshop sessions were designed to train participants in how to undertake migration surveys and to develop the specific design of the South African survey. To insure maximum opportunity for comparative analyses with the material obtained from the other countries, efforts were made to use the same basic questionnaires and sample design in all four countries. Yet, each country was able to modify that design to fit its own information needs. The Workshop, therefore, reviewed and modified each of the three questionnaires to be used in the survey:

(i) the Household Questionnaire designed to obtain a household roster, information about the household as a unit, and information related to the migration status of the various household members;
(ii) the Individual Questionnaire designed to elicit information about a selected migrant or non-migrant adult member of the household, and
(iii) the Community Questionnaire designed to obtain information on the characteristics of rural locations included in the sampled areas.

In South Africa, the Workshop participants contributed importantly to modifying the questionnaires to reflect the need for more information on return migration, the relation between migration and health, and environmental considerations. The sampling design was changed (see 1.3.3 below) to meet the needs for a more national overview of migration.

1.3.3 Field Surveys

The instruments and sampling design initially developed in the Workshop were later revised to reflect adjustments dictated by field tests and staff review and by exchanges with experts in South African government agencies. The final set of survey instruments and sampling design served as the basis of the field surveys begun in November 1999 and continuing through March 2000.

In Vietnam, Ethiopia, and Guatemala, financial and logistic considerations had led to the decision to have the field surveys concentrated in five or six selected regions of each country, chosen ad hoc to represent areas significantly affected by migration. These generally encompassed one large city, a medium sized city, some smaller urban locations, and several rural areas. The sampled areas did not, therefore, constitute a national sample. Because of this, generalizations from the study areas to the country as a whole were not possible. Within each region, samples of permanent and temporary migrants as well as a sample of non-migrants were chosen to allow comparison of the three groups on socioeconomic and demographic characteristics and to provide insights on differentials in causes and consequences of permanent versus temporary movement.

In South Africa, a grant from the Human Sciences Research Council allowed a national sample to be selected so it was not necessary to select specific areas on an ad hoc basis. Also, because it was assumed that the underlying migration process was more complex than what would be reflected in a simple distinction between permanent and temporary migrants, a strictly random process was used in selecting respondents from within the sampled households. As a result, the South African survey covered a random sample of the black population of the country, stratified into metropolitan, other urban, and rural areas. It encompassed 56 locations spread across South Africa.
1.3.4 Analysis Phase

Following completion of the major part of the data collection and subsequent data capture, a member of the PSTC visited CENPOPS to work with the local staff in checking the quality of the data and developing plans for the data analysis, especially for the papers to be prepared for the National Report and the Evaluation Seminar. Before any such visit, extensive exchanges were held via Internet; these allowed preliminary data checks and tabulations to be made at Brown University and facilitated work on the materials when the visit occurred. Dr. Yanyi Djamba, Research Associate at PSTC, made such a visit to CENPOPS in June 2000. It proved most useful both as a training procedure and in advancing the analysis of the rich data set yielded by the field surveys.

1.3.5 Evaluation Seminar

The Evaluation Seminar was held at Pretoria University July 11-13, 2000. On the day before holding the formal sessions of this Evaluation Seminar for the South African project, an informal seminar was held for those who were responsible for organizing and supervising the field operations and data collection. An excellent set of discussions concerning the strengths and weaknesses of the study design and the challenges faced in implementing the sample design and the data collection programs ensued. Suggestions were made on how the training phase of the project could be improved. Most impressive were the dedication of the team and the ways in which they coped with problems they encountered. It is clear that the field operations constituted a good experience for them and that the survey yielded a high quality data set. This provides confidence in the success of the overall endeavor in meeting the goals for which the project was developed – training and research with usefulness for policy formulation. We are therefore very optimistic that the project will have considerable value both for South Africa and worldwide for scholars and planners interested in migration in developing countries, especially those undergoing significant economic, social, and political transitions.

Participants in the Evaluation Seminar included supervisors of the data collection process, staff of CENPOPS and PSTC, government officials, students, and representatives of UNFPA and population programs at other universities. The purpose of the seminar was fourfold:

(a) It allowed assessment of the research experience on the part of those actively involved in the sample design, survey operations, and preliminary data analysis. The strengths and
weaknesses of the organization of the project and of the various stages of the research process were reviewed critically with special attention to how these affected the quality and usefulness of the data. Recommendations were made for changes in future research design of studies focusing on migration in South Africa and other developing countries.

(b) Comparisons were made of how migration differed among regions and between urban and rural places.

(c) Initial findings from the analyses of the national data set were presented and critically reviewed. Consistent with the theme of the project, emphasis was placed on the interrelations among migration development, women's status, health and reproduction.Areas for further analysis were identified.

(d) The policy implications of the findings were identified and discussed with policymakers participating in the seminar.

Because South Africa was added to the UNFPA project late, after support from the Mellon Foundation was obtained, it had the option of scheduling its training/research agenda later, but chose to condense the period in order to be able to participate in the International Seminar, scheduled for late 2000. This meant that the research team in South Africa had considerably less time to undertake analyses of the rich data set than did either Vietnam or Ethiopia.

1.3.6 International Seminar

An International Seminar was held at Brown University 25-27 October 2000. Representatives of the project teams in each of the four participating countries attended along with invited personnel from UNFPA, the Mellon Foundation, and other foundations and agencies interested in migration as well as faculty and graduate students from Brown University. The seminar provided opportunities, both formal and informal, for participants from the projects to share and compare research experiences and preliminary findings with each other and with others interested in migration in developing countries. Reports on initial findings related to the four themes of the training/research project – interrelations among migration and development, women's status, health, and reproduction - were presented. The presentations and discussion provided a good basis for gaining insights into how the social, economic, and political transitions that have characterized the four countries have affected population redistribution, for suggesting how the findings can be used for policy formulation, and for pointing to the directions in which further training and research in survey methodology and data analysis can move in these and other developing countries.
1.4 Conclusion

We must recognize that completing the fieldwork after the death of Kobus Oosthuizen, processing the data, and preparing this Evaluation Seminar and International Seminar required strong input from others. We are all most grateful to Professor Louis van Tonder for taking over the leadership role from Professor Oosthuizen and for all the technical and logistic support of Pieter Kok, Johan van Zyl, and especially Niel Roux. Without them, the project would not have moved ahead as expeditiously and effectively as it did. All of us are most appreciative to the Mellon Foundation and to the Human Sciences Research Council for their financial support and understanding.
CHAPTER 2: METHODOLOGY AND DESIGN

Alice Goldstein
Jacques Pietersen
Niël Roux

2.1 Sample design and sample selection

For this study, a national sample of the African South African population 18 years or older was drawn. South Africa was stratified into three primary strata: (a) metropolitan areas, (b) other urban areas and (c) rural areas. Samples were then drawn independently from each of the three types of localities. Initially, in each of the three locality types, 800 respondents were to be drawn, resulting in a total sample size of 2,400. The 800 respondents in each stratum were to be drawn from 20 randomly selected Primary Sampling Units (PSUs), either a “transitional local council” (TLC) or a “transitional rural council” (TRC) in the following way: Four Enumerator Areas1 (EAs) would be randomly selected in each PSU. From each selected EA 10 households would be randomly selected, and finally, one adult respondent would be selected randomly in each household.

It was later decided to draw 11 households in each EA, instead of 10, to ensure that there would be sufficient room to deal with refusals and non-responses.

2.1.1 Allocating PSUs to the strata

The first stage of the sampling process was the drawing of the 20 PSUs (TLCs/TRCs) in each of the three primary strata. This was done as described below.

(a) Metropolitan areas

Four secondary explicit strata were formed within this stratum. They were Gauteng, Durban Metro, Cape Metro and PE-Uitenhage-Kirkwood. The 20 PSUs that had to be drawn in these four strata were allocated using the proportion migrants as well as the total population in each of the strata, as observed during Census ‘96. This was done to ensure that not too many PSUs were allocated to a very small stratum purely because of a high proportion of migrants in that stratum.

1 Refers to areas that are delimited by Statistics South Africa and contain between 170 and 250 households.
Using both the proportion migrants and the total population meant that in such a case the small population reduced the allocation to that stratum. The following table shows the final allocation of the 20 PSUs in the four metropolitan strata.

<table>
<thead>
<tr>
<th>Stratum</th>
<th>Allocation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gauteng</td>
<td>6</td>
</tr>
<tr>
<td>Durban Metro</td>
<td>8</td>
</tr>
<tr>
<td>Cape Metro</td>
<td>4</td>
</tr>
<tr>
<td>PE-Uitenhage-Kirkwood</td>
<td>2</td>
</tr>
<tr>
<td><strong>TOTAL</strong></td>
<td><strong>20</strong></td>
</tr>
</tbody>
</table>

In each of these four secondary strata, the following procedure was followed to draw the required number of PSUs. The PSUs were grouped into three categories according to the proportion migrants, resulting in a category that would contain PSUs with a high proportion migrants, a category that would contain PSUs with a medium proportion migrants and a category that would contain PSUs with a low proportion migrants. The number of PSUs allocated to the stratum was then allocated to these three categories such that more PSUs were drawn in the 'high proportion migrants' category, fewer in the 'medium proportion migrants' category and the smallest number in the 'low proportion migrants' category. As will be seen later, any potential bias in this allocation would be rectified by weighting (see ‘Unequal weights’ below.) The following table shows the allocation to the three categories for each of the four secondary strata.

<table>
<thead>
<tr>
<th>Stratum</th>
<th>Allocation (High : Medium : Low)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gauteng</td>
<td>3 : 2 : 1</td>
</tr>
<tr>
<td>Durban Metro</td>
<td>6 : 2 : 0</td>
</tr>
<tr>
<td>Cape Metro</td>
<td>2 : 1 : 1</td>
</tr>
<tr>
<td>PE-Uitenhage-Kirkwood</td>
<td>1 : 0 : 1</td>
</tr>
</tbody>
</table>

Within each of the three categories, the allocated number of PSUs was subsequently randomly drawn with probability proportional to their total population, using a systematic sampling procedure. This means that the PSUs were ordered in a specific way - geographically in this case - and every k-th PSU was then drawn, with the starting point being selected randomly.
(b) **Other urban areas**

The PSUs in the other urban areas were similarly assigned to one of the three categories, namely high, medium or low proportions migrants. The 20 PSUs that had to be drawn were then allocated to these three categories, 12 to the 'high proportion' category, six to the 'medium proportion' category and two to the 'low proportion' category. The PSUs in each of these three categories were then drawn after an implicit stratification by province had been undertaken. This means that the provinces were first ordered meaningfully (and also the PSUs within each province) and then a systematic sample of PSUs (ignoring province) was drawn randomly with probability proportional to the total population.

(c) **Rural areas**

The drawing of the 20 PSUs in this stratum was done exactly the same as for urban areas, described in (b) above.

### 2.1.2 Drawing EAs in the selected PSUs

After the PSUs (i.e. the TLCs/TRCs) had been selected, four EAs were drawn in each PSU. Instead of drawing the four EAs randomly in a particular PSU, it was decided to first group the EAs in each PSU into categories containing EAs with a high proportion migrants, with a medium proportion migrants, and with a low proportion migrants. Subsequently, two EAs were allocated to the 'high proportion migrants' category, one EA to the 'medium proportion' category and one EA to the 'low proportion' category. This was done to increase the chances of including migrants in the sample.

It should be noted that this kind of allocation is totally acceptable as long as the skewness or bias that is introduced in this way is always corrected by appropriately weighting the sample elements. The EAs were subsequently drawn from the category to which they were allocated, using systematic random sampling with selection probability proportional to the size (i.e. the 1996 black South African population) of the EAs. More details on the 232 EAs selected can be found in Appendix A.

### 2.1.4 Drawing households and individuals in the selected EAs

The next step was to select 11 households in each selected EA. This was done using systematic random sampling after the fieldwork team had completed a re-listing of visiting points in the EA
to update the 1996 information. In each of the selected households, one qualifying respondent (i.e. a person 18 years or older) was randomly selected and interviewed.

2.1.5 Unequal weights

Since the allocation of sample elements was not done proportionally, it was necessary to introduce unequal weights to the sample elements in order for the sample to be a true representation of the population. The weights are given as Table 2 in Appendix A.

2.1.6 Correcting standard errors

When estimates of population parameters are reported, their standard errors are usually also reported to give an indication of the accuracy of the estimates. It should be noted that the standard errors calculated by standard statistical software packages like SAS and SPSS are calculated under the assumption that a simple random sampling approach was adopted. Since complex sample designs (specifically clustering) tend to decrease the accuracy of the estimates, the standard errors obtained from SAS or SPSS will generally be too small. Statistical software that is specifically developed to take the complex sample design into account in its calculation of the standard errors should be used. Examples of statistical software packages that have been developed for this purpose are SUDAAN and STATA.

2.2 Descriptions of the Instruments

The Study on the Relation Among Migration, Economic Change, Women’s Status, Reproduction, and Health for the Black Population of South Africa was designed to gather information through a national sample survey at several levels: the community, the household, and the individual. To do so, three different questionnaires were developed to be used in the field surveys.

2.2.1 The Community Questionnaire

A questionnaire was administered to selected knowledgeable respondents in each rural area where the survey was done. Information was sought on the basic characteristics of the community: geographic and population size, topographical features, and primary economic activities. The local situation with respect to migration was ascertained. If a receiving area,
information was gathered on the origins of the migrants and their reasons for in-migration; if a sending area, destination of out-migrants was asked and their reasons for leaving. A section of the questionnaire was devoted to ascertaining features of the local infrastructure and changes in the availability of facilities and services during the five years preceding the survey. Detailed questions were also asked about any changes in agriculture and labor force needs.

Parallel information was not asked for urban areas, since such data are available from the census and other statistical sources. Together, the data for rural and urban places can provide the background information on the contextual factors that are related to migration patterns and the decisions of individuals to migrate or not.

2.2.2. The Household Questionnaire

For each household in the sample, either the head of the household or the spouse was asked a series of some 150 questions about persons in the household and the characteristics of the housing unit.

A complete listing of all the usual residents of the household obtained information on their socio-demographic characteristics, including age, sex, relation to head, education, labor force status, occupation, place of birth, date moved to current residence if not born there, children ever born, and temporary absences from the household. Similar information was ascertained for all visitors to the household who had slept there the night preceding the interview.

A separate section of the Household Questionnaire focused on the housing characteristics, including kind of structure and facilities available. A listing of major possessions was also included, as were questions on sources of income.

The final section of the Household Questionnaire was devoted to persons who had moved out of the household since 1980 or since it was established, if after 1980. For all such persons, characteristics at time of move were ascertained, as were reasons for leaving, destination and current residence, and contacts with the surveyed household since the time of the move.
2.2.3 The Individual Questionnaire

Finally, a detailed questionnaire was administered to a randomly selected adult within the household. The major focus of this questionnaire was the migration experience of the respondent. Included, therefore, was a complete migration history that ascertained origin and destination of each move, reasons for move, the work experience of the respondent just before and after the move and occupational change.

Migrants were asked about networks used in connection with migration, and available resources, both the job search and living at destination. Remittances to home place and visits were also ascertained.

All respondents were asked details about any moves of a week or more made during the year preceding the survey. The survey also obtained information on possible future mobility within the following three years. A full fertility history was also sought for each female respondent or the current spouse if a male respondent, including information on breastfeeding and antenatal care. Finally, a section of the Individual Questionnaire was devoted to matters of health. Respondents were asked about utilization of health facilities both for themselves and for their children, and they were asked to assess their own health in comparison to others their own age and, for migrants, in comparison to their health before migrating.

The survey thus collected a wealth of data to assess the relation of migration to a broad array of other processes, and to put the migrants’ experiences within the context of their communities of destination and within the time frame of their moves. This data set also allows great flexibility in defining migration per se.

2.2.4 Defining Migration Status

Migration is defined in the Survey as movement from one district to another or, if movement is within a district, between a rural and an urban place.

(a) Using the Household Questionnaire

By using the Household Questionnaire, a distinction can be made between the usual residents of the household and the visitors. For each of these groups, information is available on place of
birth so that lifetime migration status can be determined. Non-migrants are persons who are currently living at their place of birth. Lifetime migrants are persons whose current residence is not at the place where they were born. Lifetime migrants can be further subdivided by length of residence at current place, so that it is possible to identify recent migrants (living in their current place less than 5 years) and long-term migrants (living at their current place 5 years or more). Any other time frame may be used instead. In addition, lifetime migrants can also be classified according the rural/urban character of their place of birth in relation to the rural/urban character of their place of current residence.

These definitions clearly do not identify all kinds of migration; in particular, they omit any moves made between the place of birth and current residence, nor do they distinguish persons who had moved away from place of birth but returned to it at the time of the survey. For more refined definitions of migration, the data provided on the Individual Respondent, which include a full migration history, must be used.

(b) Using the Individual Questionnaire

Further definitions of migration status can be developed, based on information in the Individual Questionnaire. These categories are not mutually exclusive. They refer to moves made after age 12.

(i) **Return Migrant**: Place of birth is the same as place of interview and the person is listed as a usual resident, but number of moves is greater than 1.

(ii) **Multiple-move Migrant**: Persons who have made 3 or more moves since age 12.

(iii) **Short-term Migrant**: Persons who have been at place of interview for less than a specified period of time – this might be variously defined as 6 months, 1, 2, or 5 years.

(iv) **Temporary migrant**: A short-term migrant who intends to move again within the next three years.

(v) **Labour migrant**: A person who indicated that economic or job considerations motivated the move and who moved alone.

Many other possible definitions and refinements of migration status are possible using the survey data. Those indicated above are among the most basic for analyses of migration in relation to economic change, women's status, reproduction, and health.
2.3 The Fieldwork

Data was gathered between September 1999 and March 2000 by a team of 13 coordinators and 36 fieldworkers. Fieldwork took place in 56 areas that included 232 enumerator areas around the country.

2.3.1 Selection and training of the fieldworkers

The 13 coordinators all have at least a tertiary qualification and were selected on the basis of geographical convenience, and the potential to benefit from their participation in the project. To facilitate the fieldwork, coordinators were assigned to control fieldwork in particular geographical areas. These areas were assigned to coordinators on the grounds of their relative proximity to each other and the coordinator’s base town or city. This was done to facilitate logistics and limit transport and accommodation costs. The various areas were nevertheless fairly scattered within provinces, with the exception of Gauteng and the Western Cape and enumerator areas in and around the metropolitan areas. This dispersion was especially severe in the rural areas. Two coordinators were handed responsibility for KwaZulu-Natal, one each for the Free State and the Western Cape, and two each for the Northern Province, Eastern Cape, North West Province and Mpumalanga. A member of the HSRC in Pretoria coordinated fieldwork in Gauteng.

Many responsibilities were delegated to coordinators. They had to make logistical arrangements, as well as develop capacity building within their geographic areas. The latter task especially fitted well into the goals of the Mellon Foundation, which funded the project. Coordinators’ primary tasks included:

- the location of sampled EA’s in the various PSU’s
- the re-listing of visiting points in the EA to update the 1996 information,
- drawing a systematic random sample of visiting points in each EA using this information,
- the general supervision of fieldwork, and
- preliminary quality control in the field.

Coordinators were given the freedom to choose their own fieldworkers. The only condition was that fieldworkers at least had to have a matric certificate. Command of the most widely spoken language in the proposed sample areas was also preferable. Each coordinator chose between two and three fieldworkers to assist them. The majority of fieldworkers had previous survey
experience, since many had worked on previous Demographic and Health Surveys (DHS’s) and censuses. Although this probably eased the process, fieldwork training was still essential.

Both the coordinators and fieldworkers were thoroughly trained on a number of occasions. Coordinators were first trained at the Training Workshop in Pretoria during May 1999 for a period of two weeks. During this time they were lectured on a variety of theoretical and practical issues relating to migration in general and the project in particular. These lectures were designed to increase their interest in migration while also providing them with the skills to conduct the fieldwork phase of the survey. Instruction during the first week included reading maps and aerial photographs, interview skills, and how to gain access to proposed sample communities. The questionnaire was discussed comprehensively during the second week. To improve their understanding of the questionnaire and the process, coordinators were encouraged to conduct test interviews with other coordinators as well as with students on the campus of the University of Pretoria. Coordinators were subsequently trained again on location in their allotted survey areas together with their fieldworkers for not less than three days. During this training, the questionnaires were discussed for two days followed by a practical day.

2.3.2 Piloting and pre-testing of the questionnaires

The questionnaire was only available in English. In the pilot study which was done in May and June 1999, content, key concepts, sensitivity, length, sequencing, logical flows and clarity were assessed. A number of modifications were made accordingly, and the revised instruments were finalised and then printed.

2.3.3 Data collection procedure

Before fieldwork could start in any given community, the fieldwork coordinators first had to negotiate access to the community. Although this process took time, it markedly improved response rates. As a result fieldworkers reported excellent cooperation on the part of respondents, and very few refusals. Households were approached by the fieldworkers to complete the questionnaires after they had been selected from the chosen enumerator areas (refer to the previous section dealing with the sample). Fieldworkers were instructed to identify themselves, explain the project, and read a letter of introduction written by the study leaders in Pretoria. Once they had permission to continue, the household questionnaire was completed by
asking any capable individual age 18 or older questions regarding all other members of the household.

For the purposes of the study, a household was defined very loosely as all the people living together (not necessarily under the same roof) and sharing a kitchen (pot). The respondent for the household questionnaire determined who were residents of the household. Information was recorded only for members of the household or individuals who had slept in the household the previous evening. In the case of group quarters (hostels), each unrelated person was considered a single-person household, although they might have shared meals or were living in the same room. Once the household questionnaire was completed, the household roster was used as a framework from which a systematic random sample was drawn. The selected individual was next interviewed for completion of the individual questionnaire. Coordinators completed the community questionnaire in rural tribal areas with the help of a group of four or more selected community leaders.

To minimize non-responses, fieldworkers were instructed to return to sampled households on at least three occasions spread over at least two days. No substitutions were allowed. Although no one was forced to participate in the study, supervisors were asked to discuss the issue with refusing individuals by clarifying the process and stressing the confidentiality of participation. This was very important since many initial refusals were based on misconceptions and misunderstandings. Refusals were dealt with before the misconceptions, misunderstandings, and malice that so frequently accompanied them could jeopardise the project by undermining the good will of the communities in question.

2.3.4 Quality control: checking, editing and revisits

The quality of the completed questionnaires was assured by building in a number of checks. These checks included manual verification by the coordinators together with a 10% sample check-back by coordinators accompanying their fieldworkers in the field. Once coordinators were satisfied with the quality of questionnaires, they were posted back to the University of Pretoria, where they were checked one more time.

A number of problems were encountered during the field work. Despite all the advantages of a national sample, the survey did not have adequate financial or personnel resources to do justice
to such an enormous venture. The immense distances produced great logistical difficulties, time delays and not least of all, substantial transport and accommodation costs.

Vast distances and the use of the postal service to courier questionnaires increased the time it took to receive questionnaires in Pretoria, send them back for some editing, receive them back in Pretoria before finally accepting them and making payments to fieldworkers. Although this process took time, miraculously no questionnaires were lost in the postal system. Nonetheless, some problems were experienced regarding timely payments of fieldworkers, causing some morale problems among some fieldworkers. All of this caused havoc with time schedules. To confound the situation, the original study leader, Kobus Oosthuizen, died midway through the fieldwork phase. This led to some confusion and ultimately some delays in the fieldwork. Despite these factors data quality proved to be satisfactory.

2.4 Data processing

2.4.1 Data editing and coding

After the questionnaires were checked in the field by the coordinator, they were sent to the Centre for Population Studies (CENPOPS) at the University of Pretoria, where they were reviewed and either accepted or sent back to be edited or redone. The amount of re-editing clearly reflected the intensity of supervision exercised by the coordinators.

The coding of the open questions and especially the coding of the previous places of residence was cumbersome in that place names were sometimes misspelled or used only in the specific community. It was therefore decided to code only the magisterial district of the previous place of residence, and not to give a code for the place.

2.4.2 Data entry

The data entry was done by the Human Sciences Research Council (HSRC). The questionnaires were designed to enable the use of SPSS-DE for data entry. Initially, the plan was for students of the Department of Sociology to do the data entry, but because of delays in the field work, this became impractical. We therefore turned to the professionals at HSRC. Their data entry systems delivered the data as ASCII-files, which then had to be converted to SPSS files.
2.5 Data quality assessment

After completion of the data entry and before the Evaluation Seminar, Dr. Yanyi Djamba visited CENPOPS to assist in producing some tabulations of the South African migration dataset in order to assess the quality of the data.

Attention in the household data file was particularly given to age, education and occupation variables as well as the variable indicating the previous place of residence.

In the individual data file, attention focused on the migration history. The ten last moves of the respondents were recorded; a large number of inconsistencies were found and corrected. The fertility and family planning section also received attention to ascertain that the birth histories (up to 10 children were recorded) were correct.

Despite some inconsistencies, Dr. Djamba was very satisfied with the quality of the data set and indicated that it compared favorably with the data sets from the three other countries that had undertaken similar migration surveys.
MIGRATION SURVEY

(Household Questionnaire)

1999

Number of Questionnaire/Household

V0001
Dear Sir/Madam

You have been selected to participate in a survey designed to collect information on patterns of population movement in South Africa. The research is being carried out by the Centre for Population Studies at the University of Pretoria in collaboration with the Human Sciences Research Council in Pretoria and the Population Studies and Training Center of Brown University in the United States. This study is part of a larger study that includes Vietnam, Ethiopia and Guatemala and that is funded by the United Nations Fund for Population Activities (UNFPA). The South African part of the study is funded by a private Foundation (the Mellon Foundation) and the Human Sciences Research Council. Prof. Kobus Oosthuizen, Director of the Centre for Population Studies in Pretoria is heading the project in South Africa.

We will be collecting information that will be useful for planners and policy makers in developing programs to help improve the quality of life of the South African population. In particular, we hope to gain better understanding of the interrelations between migration, economic conditions, housing, women’s status, land reform, health, fertility and the provision of basic services.

Participating in this survey and answering the questionnaire will give you an opportunity to share your experiences and views on a variety of topics related to migration. Because you have been chosen to be a representative in the project, your cooperation will be very important to its success. The information collected will be strictly confidential and all information released to the public will be in general terms only, with no possibility that the individuals who have participated in the survey can be identified. Your answers are strictly voluntary and you can refuse to answer any question if you wish to do so.

If you have any questions about the survey, you may call Prof. Oosthuizen or contact the field coordinator in your area. You may ask the interviewer for the telephone number of the field coordinator.

Thank you very much for agreeing to take the time to participate in this survey.

Prof Kobus Oosthuizen  Prof Sidney Goldstein & Alice Goldstein  Prof Pieter Kok

ASK ABOUT ALL PERSONS WHO HAVE MOVED FROM THE HOUSEHOLD IN THIS PLACE AND ARE NOW LIVING ELSEWHERE, OR WHO HAVE DIED WHILE IN THIS HOUSEHOLD.

Please list all persons who have been usual residents in this household since 1980 or since it was established (after 1980) and who (1) have moved out and are now living elsewhere, but return regularly to this household, (2) have moved out and are now living elsewhere and do not expect to return to live here, and (3) have died while living in the household. Please included everyone who moved out or deaths of anyone living in the household in 1980 or at the time the household was established here, also take into account those who were born here after 1980, and those who became usual residents of the household after 1980 or after it was established.

IF NO ONE HAS LEFT THIS HOUSEHOLD, SKIP TO END OF HOUSEHOLD QUESTIONNAIRE AND USE GRID TO SELECT RESPONDENT FOR THE INDIVIDUAL QUESTIONNAIRE.

How would you rate your own health?
How would you compare your health to others your own age?

**IF THE RESPONDENT IS A MOVER**

Thinking of your health now, how does it compare to your health before you moved to this place?

1=Better now
2=Same
3=Not as good now (worse)

V1045 V1046 V1047

Have you ever had one of the following diseases?

<table>
