Overview

ABSTRACT

The 2005 Cape Area Study is a survey of aspects of diversity and inequality in the city of Cape Town, South Africa. The survey is modelled on the Detroit Area Study, conducted over an extended period by the University of Michigan in the US.

KIND OF DATA

Sample survey data [ssd]

UNITS OF ANALYSIS

Units of analysis in the survey are households and individuals

Scope

NOTES

The survey collected data on household characteristics (type, material, rooms, sanitation type) and demographic and other characteristics of household members (population group, age, gender, relationship to the respondent, education, employment situation, income). Data on the respondent's attitudes to and participation in the following was also collected: Politics and civil society, family, education, race and culture,

Coverage

GEOGRAPHIC COVERAGE

The Cape Town Metropolitan Area

UNIVERSE

The survey covered a sample of households and household members in Cape Town

Sampling

Sampling Procedure

Sampling for CAS 2005 was designed to generate a representative sample of 1200 adults spread across metropolitan Cape Town. A two-stage cluster sample design was used. First, a sample of seventy 'enumerator areas' (EAs) was selected. Secondly, a sample of about 1820 households was selected in these EAs. Anticipated different response rates in different kinds of areas required oversampling in some areas.

Questionnaires

Overview

Module A of the questionnaire collected basic data on dwelling characteristics and population group of the selected respondent.

Module B collected data on the values and social attitudes of the respondent

Module C collected data on the respondent's political attitudes and political participation

Module D collected data on the respondent's attitudes to and involvement with family and civil society

Module E collected data on the respondent's attitudes to education

Module F collected data on the respondent's attitudes to issues of race and culture

Module G is the household roster, collecting data on household members, including age, gender, relationship to the respondent, levels of education, employment situation and income. Data on dwellings (rooms, access to sanitation) was also collected in this module, plus migration data and detailed employment data for household members.

Module H collected health data.
