Overview

ABSTRACT

An omnibus survey is done quarterly and its purpose is to give clients an opportunity to participate in a national survey at low cost. A number of clients' questions are combined into one questionnaire. This questionnaire is usually administered to probability sample of 2 200 respondents in the whole country (South Africa). The 1995 February omnibus consisted of two separate samples of 2 200 each – one sample having a blue questionnaire and the other sample having a green questionnaire. The HSRC conducted 2 Omnibus surveys in 1995. The February/March 1995 omnibus survey was undertaken over the period 27 February to 24 March 1995. The data from this survey was available in May 1995. The fieldwork was done on a countrywide basis including all nine provinces.

KIND OF DATA

Sample survey data [ssd]

UNITS OF ANALYSIS

Units of analysis in the survey included individuals

Scope

NOTES

The 1995 Omnibus survey conducted in February collected demographic data (sex, age, marital status, education, language, income, occupation, population group), as well as data on the following topics:

TOPICS

Topic	Vocabulary	URI
social behaviour and attitudes [13.6]	CESSDA	http://www.nesstar.org/rdf/common

Coverage

GEOGRAPHIC COVERAGE

The survey had national coverage, including coverage of the 'homelands' of Ciskei and Venda.

GEOGRAPHIC UNIT

The lowest level of geographic aggregation covered by the data is magisterial district

UNIVERSE

The universe included all household residents 18 years old or older

Sampling

Sampling Procedure

For the survey, the South African population of persons 18 years and older was stratified according to:

Province (Western Cape, Eastern Cape, Northern Cape, Orange Free State, Natal/KwaZulu, Eastern Transvaal, PWV, North Western Province, Northern Transvaal)

Socio-economic classification:

Rural areas in former self-governing and TBVC states

Squatter areas in former non-white urban (metro and non- metro areas)

Hostels and hotels

Former urban areas for coloureds

Former urban areas for a Asians

Former urban areas for blacks

Former urban (non- metro) areas for whites

Former urban (metro) areas for whites

Rural areas, excluding the former self-governing and TBVC states

The sample allocation to these strata was done roughly proportional to the adjusted 1991 population census figures with a few exceptions, among which was to ensure a minimal provincial total of 120. Multistage stratified cluster (probability) sampling was used to draw the respondents with the adjusted 1991 population census figures as measure of size. Census enumerator areas and similar areas were used as the clusters in the pen-ultimate sampling stage, from which an equal number, viz. one or two by four households were drawn. All clusters were drawn with probability proportional to size, whilst households were drawn from the final clusters with equal probability (systematically). Respondents were drawn at random from qualifying household members. In addition, population of live-in domestic workers was sampled in relation to their residence in already drawn households.

Weighting

The sample design allocation per population group was not proportional to the population figures as given in the adjusted 1991 census figures as well as updated figures for certain areas such as the former TBVC states. The population total for each region and socioeconomic category was divided by the actual realisation in the particular cell. The figure derived is the pre-weight that was used. The data was weighted for the age group 18 years and older, in other words, the population that qualified as respondents.

The aim of the factor weighting was to correct the disproportions which were incorporated in the sample design (minimum number of 120 respondents per province, over-sampled population of Asians) and the only weighting targets were stratification variables: 'province' and 'socio-economic category'.
