

GCRO – Quality of Life Survey 3 – 2013

Final Weight Calculations

The sample sizes used in the design of the survey were intended to match the 2011 census as regards the number of respondents in each ward, and the random selection of households in each ward as well as the random selection of inhabitants within a household should, on average, have resulted in the correct representation of the race and gender of the respondents in the ward. However, the realities of the survey meant that neither objective was realised. For example, Table 1 (extracted from the last three rows of Table 2) gives the percentage representation of each race/gender category used in the survey:

TABLE 1

Race	African		Coloured		Indian/Asian		White		Other	
Gender	Male	Female	Male	Female	Male	Female	Male	Female	Male	Female
Survey %	35.04%	48.84%	1.33%	1.92%	1.04%	0.78%	5.40%	5.25%	0.24%	0.16%
Census 2011 %	39.31%	38.05%	1.66%	1.79%	1.47%	1.43%	7.59%	8.01%	0.41%	0.28%
Weighted Survey %	39.11%	37.42%	1.52%	1.72%	1.48%	1.44%	7.93%	8.63%	0.46%	0.28%

It is evident that whereas almost all of the 10 categories are under-represented in the survey compared to the 2011 census, especially white males and females, African females are hugely over-represented. There are probably many reasons for this, for instance that African females are more likely to be at home when the survey team arrives. It is also clear that in order to avoid serious biases in the survey results, such as when estimating the average household income in Gauteng, the results need to be weighted so as to make them more representative of the “true” demographic profile of the population as represented by the 2011 census.

It is also evident from the “Unweighted Row %” and “Census %” columns in Table 2, that the wards are in many cases poorly represented in the survey. For example, Ward 74804015 is under-represented by a factor of 2.78, whereas on the other hand Ward 74202009 is hugely over-represented by a factor of 13, compared to the 2011 Census.

It is generally not possible to weight the rows and columns of Table 2 so as to simultaneously match the Census percentages for the race/gender categories as well as for the wards, but an iterative re-weighting, or “raking” procedure (Battaglia et al, 2004) is a simple approach to achieving this as closely as practically possible. The procedure is applied by first weighting the columns of the table of survey results and then the rows and then checking whether the discrepancies in the representativeness of the columns is acceptable (since the rows were last weighted, they will correspond exactly to the census figures). If not, then the procedure is repeated once or more times until the discrepancy in the representativeness of the columns is acceptable. (By first

weighting the rows and then the columns and repeating if necessary, the columns will be represented exactly and the discrepancies in the rows will be minimised. Since it was decided that matching the ward numbers was more important, they were always weighted last in the iterative process.) After three iterations of the re-weighting procedure the match of the numbers in the race/gender categories to the census figures were considered acceptable, as indicated in the last row of Table 1. The “Weighted row” column of Table 2 confirms that all wards are now correctly matched to the census figures.

Table 2 gives the resulting set of weightings that were applied to the sample numbers in each of the race/gender categories within each of the wards.

Notes:

1. In practice, the weights were applied in the final QoL Survey SPSS database in the field *GCROweight*
2. For the 2013 QoL survey, the weights were developed jointly by Grant Hayward and Paul Fatti
