General information

Stats SA publishes approximately 300 different statistical releases each year. It is not economically viable to produce them in more than one of South Africa's eleven official languages. Since the releases are used extensively, not only locally but also by international economic and social-scientific communities, Stats SA releases are published in English only.

Stats SA has copyright on this publication. Users may apply the information as they wish, provided that they acknowledge Stats SA as the source of the basic data wherever they process, apply, utilise, publish or distribute the data; and also that they specify that the relevant application and analysis (where applicable) result from their own processing of the data.

Living Conditions Survey 2015: Metadata/Statistics South Africa. Pretoria: Statistics South Africa, 2017

[Statistical Release P0310 (2017)]

ISBN: 978-0-621-45185-6

Advance release calendar

An advance release calendar is disseminated on www.statssa.gov.za.

Stats SA products

A complete set of Stats SA publications is available at the Stats SA Library and the following libraries:

National Library of South Africa, Pretoria Division
National Library of South Africa, Cape Town Division
Natal Society Library, Pietermaritzburg
Library of Parliament, Cape Town
Bloemfontein Public Library
Johannesburg Public Library
Eastern Cape Library Services, King William's Town
Central Regional Library, Polokwane
Central Reference Library, Mbombela
Central Reference Collection, Kimberley
Central Reference Library, Mmabatho

This report is available on the Stats SA website: www.statssa.gov.za.

CD-ROM is available from: Reprographics, Statistics South Africa

THE INSTRUMENTS OF DATA COLLECTION

The Living Conditions Survey 2014/2015 used three data collection instruments, namely the household questionnaire, the weekly diary and the summary questionnaire to collect information from households.

Household questionnaire

The household questionnaire was a booklet of questions. These questions, which were split into 26 sections and spread across four modules, were administered to respondents on different occasions during the course of the survey period. One module dealt with establishing the household (approximately one per week). The first module dealt with establishing the composition and structure of the household, as well as capturing particulars of all household members, including particulars on education and employment. The second and third modules contained the bulk of the expenditure-related questions and covered various expenditure areas, such as housing, clothing and footwear, telecommunications, transport, furniture and equipment, education and health. These two modules also include questions on household assets, welfare, socially perceived necessities and crime. The fourth module comprised sections on subsistence, living circumstances and food security, finance and banking, as well as particulars of income.

Weekly diaries

This is a booklet that was left with the responding household to track all acquisitions made by the household during the diary-keeping period. The household (after being trained by the Survey Officer) was responsible for recording all their daily acquisitions, as well as information about where they purchased the item (source) and the purpose of the item. A household completed a different diary for each week of the survey period.

Summary questionnaire

This was a booklet of questions for the sole use of the Survey Officer. The instrument has two primary functions. First, it serves as a code list for Survey Officers when assigning COICOP (Classification of Individual Consumption According to Purpose) codes for the reported items recorded in the weekly diary. Second, it helps to summarise the household's total consumption

expenditure on a weekly basis to allow the Survey Officers to better understand the household's acquisition patterns, so as to ensure accuracy and completeness of the diary.

HOW THE LCS 2014/2015 WAS CONDUCTED

Sampled households participated in the survey for a period of four weeks. The survey instruments were administered in stages at different visits during the four weeks of data collection. A module was administered at the beginning of each week. A detailed list of activities conducted each week is shown in Table 1.

Table 1: Data collection activities by week for the LCS 2014/2015

Week 0 <i>(Week before diary-keeping)</i>	Weeks 1 to 2 <i>(Diary-keeping week)</i>	Week 3 <i>(Week after diary-keeping)</i>
<ul style="list-style-type: none">• Hand-over by publicity team• Establish rapport with household• Train household on diary completion• Conduct interview 1• Make appointments for anthropometric measurements	<ul style="list-style-type: none">• Drop off weekly diaries to be completed by household• Conduct interviews 2 and 3• Collect and verify completed diaries for week 1• Codification by means of the summary questionnaire• Conduct anthropometric measurements	<ul style="list-style-type: none">• Conduct interview 4• Collect and verify completed diaries for week 2• Codification by means of the summary questionnaire• Conduct any outstanding anthropometric measurements

TIME SPAN

Data collection for the Living Conditions Survey 2014/2015 was conducted over a period of one year between 13 October 2014 and 25 October 2015, with the diary-keeping period starting on 20 October 2014 and ending on 19 October 2015. Publicity operations for the survey began in September 2014 and were run in parallel with data collection activities until the end of the survey.

SAMPLE COVERAGE

The sample for the survey included all domestic households, holiday homes and all households in workers' residences, such as mining hostels and dormitories for workers. It did not include institutions such as hospitals, prisons, old-age homes, student hostels and dormitories for scholars. Boarding houses, hotels, lodges and guesthouses were also excluded from the sample.

RESPONSE DETAILS

From the 30 818 dwelling units sampled across the country, 32 906 households were identified by the survey. Out of these, there was a sample realisation of 27 527 (83,65%) households, with the remaining 5 379 (16,35%) households being classified as out-of-scope due to a number of reasons, such as listing error, vacant/unoccupied dwelling, etc. Table 2 below shows the response rates for the LCS 2014/2015 by province.

Table 2: Response rates for the LCS 2014/2015 by province

Province	LCS 2014/2015 (%)
RSA	84,9
Western Cape	79,1
Eastern Cape	92,7
Northern Cape	90,4
Free State	86,9
KwaZulu-Natal	89,6
North West	90,0
Gauteng	65,3
Mpumalanga	91,6
Limpopo	95,6

Despite the legislative power of the Statistics Act (Act No. 6 of 1999), which compels sampled households by law to participate in Stats SA surveys, we have seen a general decrease in response rates since the introduction of the diary and recall methodology in 2005/06 (see Table 3 below). Overall, we do see lower rates for the two LCS points compared to the IES points. This is likely due to the extra burden that the LCS places on respondents for anthropometric measurements and a generally longer questionnaire that is designed to meet poverty objectives in addition to the CPI objective.

Table 3: Response rates for the IES 2005/2006, LCS 2008/2009, IES 2010/2011 and LCS 2014/2015 by province

Province	IES 2005/2006 (%)	LCS 2008/2009 (%)	IES 2010/2011 (%)	LCS 2014/2015 (%)
RSA	96,8	88,0	91,6	84,9
Western Cape	94,1	85,2	94,3	79,1
Eastern Cape	99,6	94,2	95,8	92,7
Northern Cape	98,7	90,4	95,6	90,4
Free State	98,5	95,9	94,7	86,9
KwaZulu-Natal	95,9	84,8	92,3	89,6
North West	97,1	89,3	91,6	90,0
Gauteng	95,3	79,7	82,9	65,3
Mpumalanga	96,4	88,5	93,5	91,6
Limpopo	97,7	94,9	90,3	95,6

DATA COLLECTION

There are three main approaches used to collect data on household consumption expenditure, namely the acquisition, the payment and the consumption approaches. All three methods were used at some stage during data collection for the LCS 2014/2015.

The *acquisition approach* entails taking into account the total value of goods and services acquired (not necessarily consumed, but acquired for household consumption purposes) during a given period, whether the household paid for them or not. This is the general approach that was followed for most of the items. Information on non-durable, semi-durable and durable items is collected using the acquisition approach.

The *payment approach* takes into account the total payment made for all goods and services in a given period, whether the household has started consuming them or not. This approach is followed when collecting data of expenditure on services such as education, health, insurance, etc.

The *consumption approach* takes into account the total value of all goods and services consumed or used during a given period. This approach is used when collecting information on own production.

DATA PROCESSING

Data processing refers to a class of computer programs that organise and manipulate large volumes of numeric data. Data processing involved the processing of completed instruments; in the case of the LCS 2014/2015, these included household questionnaires, diaries and the summary questionnaires. Information received from these instruments collected during fieldwork was converted into electronic format represented by numbers or characters. The main method used for this conversion was scanning. To ensure quality electronic data, the data were verified, as well as edited and checked for consistency according to the predetermined editing rules. All information contained in damaged instruments that could not be scanned was identified and transcribed onto clean instruments in order to be scanned.

Coding of acquired items

Coding is the process of assigning numerical values to responses to facilitate data capturing and processing in general. The code list for acquired items was based on the United Nations Classification of Individual Consumption According to Purpose (COICOP). Codes were assigned to expenditure items and listed in the diaries by field staff while the head office staff did coding for the household questionnaire. During data processing, all assigned codes were checked and improved when necessary to ensure and enhance quality.

DATA EDITING AND IMPUTATION

Decision table technology was used to develop edit rules that were compiled to produce SAS edit programs for the purpose of identifying logical, consistency and out-of-range errors. Once identified, these errors were manually fixed on the system after verification against corresponding scanned images of the survey instruments. The introduction of a 3-digit check number helped in the reduction of human error often introduced by COICOP coding in the field.

Within the money-metric sections of the household questionnaire, all data entries for specific expenditure items were considered for analysis, even if the preceding filter question might have indicated otherwise. If there was a conflict, the latter was changed to a 'Yes'. All skips in the household questionnaire were treated in a similar fashion.

In the case of missing key demographic variables (age, sex and population group), hot-deck imputation was used. For the age variable, the age of 0,2% of the respondents was imputed; for the sex variable, the sex of 0,4% of the respondents was imputed; and for the population group variable, the population group of 0,2% of the respondents was imputed.

Not all households that participated in the survey automatically qualified to be included in the final data. Households were disqualified from inclusion if they did not have a completed household questionnaire or if the questionnaire did not have information for Section 1 (personal information) and/or Section 6 (housing). Households that did not have any diary information were also disqualified. Therefore, to be included in the final dataset, a household needed to have a household questionnaire with Sections 1 and 6 properly completed, and with diary information for at least one week. If a household had only one week of diary information, imputation was done for the missing week. A random donor household was chosen from a cluster of households with similar characteristics and its corresponding diary was used to impute for the missing diary.

For owner-occupied dwellings, a rental yield of 7,135% was applied to the total value of the dwelling to determine housing expenditure for that household. This was the average rental yield (based on quarterly data) that corresponds to the timeframe of the LCS 2014/2015. This single rental yield was applied across the board, irrespective of province, type of settlement or type of housing.

DATA ORGANISATION

Data collected from the LCS 2014/2015 had to be reorganised to make sense to facilitate meaningful further analysis. Diary data were multiplied by 26 weeks to get an annual value. The questionnaire data were multiplied by 12 months if the COICOP (Classification of Individual Consumption by Purpose) was defined as monthly, and the questionnaire data were multiplied by 1 if the COICOP was defined as annual. This process is known as annualisation.

Since the survey took place over a period of 12 months (13 October 2014 to 25 October 2015), it was necessary to benchmark the reported expenditure data to April 2015, which was midway into the survey year. All the expenditures incurred before the end of March 2015, i.e. before April 2015, were inflated to April 2015 prices and all the expenditures incurred after April 2015 were deflated back to April 2015 prices using CPI data.

Although many data files were generated from the processed data, they all served as input files into what is considered the five primary data files that are released to the public, namely:

LCS2015_persons_final: This is the persons file. This file contains all information regarding the persons in the households that responded to the survey. Particulars of each person as captured on the flap and in Sections 2 to 4, Section 18, as well as Sections 24 and 25 of the household questionnaire are found in this file.

LCS2015_households: This is the household file. This file has all information collected about household characteristics. The information is extracted from Section 1 and Sections 5 to 24 of the household questionnaire.

LCS2015_Personsincome: This file contains information on personal income. Income at personal level is sourced from Section 24 of the household questionnaire.

LCS2015_Household_assets: This file contains information on household assets. The household assets section is Section 6 of the household questionnaire.

CONCEPTS AND DEFINITIONS

Acquisition approach – An approach taking into account the total value of goods and services actually acquired during a given period, whether fully paid for or not during that period.

Classification of Individual Consumption According to Purpose (COICOP) – International system of classification of goods and services based on individual consumption by purpose.

Consumer price index (CPI) – An index that measures the price of a fixed basket of consumer goods and services.

Consumption approach – An approach that takes into account the total value of all goods and services consumed (or used) during a given period.

Consumption expenditure – Expenditure on goods and services acquired, and privately used by household members, including imputed values for items produced and consumed by the household itself.

Diary – A record with discrete entries arranged by date reporting on what has happened over the course of a defined period of time. With regard to the IES and LCS, diaries recorded all

acquisitions made by the household during the diary-keeping period. This included the description of the item, value, source, purpose, area of purchase and the type of retailer.

Durable goods – Household items that last for a long time, such as kitchen appliances, computers, radios, televisions, cars and furniture, usually acquired once in several years.

Dwelling unit (DU) – Structure or part of a structure or group of structures occupied or meant to be occupied by one or more than one household.

Enumeration area (EA) – The smallest geographical unit (piece of land) into which the country is divided for census or survey purposes.

Farm – An area of land, together with its buildings, concerned with the growing of crops or the raising of animals.

Gift – An item received by the household from people who are not members of the household or items given away by members of the household to non-members, without compensation.

Household – A group of persons who live together and provide themselves jointly with food and/or other essentials for living, or a single person who lives alone.

Household head – A person recognised as such by the household, usually the main decision-maker, or the person who owns or rents the dwelling, or the person who is the main breadwinner.

Household income – All receipts by all members of a household, in cash and in kind, in exchange for employment, or in return for capital investment, or receipts obtained from other sources such as social grants, pension, etc.

Income (individual) – All money received from salary, wages or own business; plus money benefits from employer, such as contributions to medical aid and pension funds; plus all money from other sources, such as additional work activities, remittances from family members living elsewhere, state pensions or grants, other pensions or grants, income from investments, etc.

Income-in-kind/expenditure-in-kind – This refers to items acquired by the household without paying for them, e.g. bursaries, subsidies from employer, free medical services, private use of a company car or similar vehicle, value of discounted fares for educational purposes, grants from schools and other educational institutions, excluding gifts and maintenance from other household members.

Master sample (MS) – A sample drawn from a population for use on a number of future occasions, so as to avoid ad hoc sampling on each occasion.

Non-durable goods – Household items that do not last long, for example food and personal care items. Households usually acquire these items on a daily, weekly or monthly basis.

Own production – Own production is the activity of producing goods that the household can consume or sell in order to supplement the household income. Many households – especially low-income households – need to grow food items such as vegetables, mealies, etc., or to keep chickens or livestock to consume and/or sell so that they can provide more adequately for themselves.

Payment approach – An approach taking into account the total payment made for all goods and services in a given period, whether the household has started consuming them or not.

Primary sampling unit (PSU) – Geographical area comprising one or more enumeration areas of the same type (and therefore not necessarily contiguous) that together have at least one hundred dwelling units.

Rural – Farms and traditional areas characterised by low population densities, low levels of economic activity and low levels of infrastructure.

Sample – Part of the population on which information can be obtained to infer about the whole population of units of interest.

Settlement type – Classification according to settlement characteristics.

Semi-durable goods – Items that last longer than non-durable goods but still need replacing more often than durable goods, for example clothing, shoes and material for clothing.

Traditional area – Communally owned land under the jurisdiction of a traditional leader.

Urban – Formal cities and towns characterised by higher population densities, high levels of economic activities and high levels of infrastructure.

Vacant dwelling – Dwelling that is uninhabited, i.e. no one lives there.

Visitor (household) – Person visiting or staying with a household who is not a usual member of the household.

Weighting

The sample weights for the LCS in 2014/15 were constructed in such a manner that the responses from the respondent persons and households could be properly expanded to represent the entire population. The sample weights therefore are the result of calculations involving several factors, including the original selection probabilities, adjustments for PSUs that were sub-sampled or segmented, excluded population from the sampling frame, unit non-response, weight trimming and benchmarking respectively to known population estimates.

Base weight

Design Weight

The initial design weight for each sampled household had already been computed as part of the sample design process and is equal to the inverse of the probability of selection, which simply is the inverse of the sampling rate (ISR). The sampling rate had been assigned at the province level, i.e. all design strata within a province had been sampled at the same rate. Thus, the initial design weight assigned to each household in a province is simply the ISR for the province and is given in Table 3 below.

Let N_p be the household count as at Census 2001 from the province p and n_p the corresponding required household sample size; then the ISR is given by:

$$ISR_p = N_p / n_p \quad (1)$$

Table 4: The inverse sampling rate by province

Province	Inverse Sampling Rate
Western Cape	290
Eastern Cape	350
Northern Cape	115
Free State	230
KwaZulu-Natal	365
North West	260
Gauteng	420
Mpumalanga	245
Limpopo	310

Primary Sampling Unit Adjustment

The sample selection methods or sampling rates within PSUs were modified during DU sample selection in two different scenarios; that is the segmentation of informal PSUs and sub-sampling within growth PSUs, for reasons related to operational feasibility and/or cost implications. The initial design weights were adjusted to account for these modifications in the

selection methods or sampling rates by a PSU adjustment factor that had been computed as part of the DU sample selection process. The PSU adjustment factor for the i^{th} PSU was defined as:

$$PSU_ADJ_i = \begin{cases} Expected\ PSU\ Yield_i / Segment\ Yield_i, & \text{where Segmented PSUs} \\ Revised\ ISR_i / Original\ ISR_i, & \text{where Growth PSUs} \\ 1, & \text{otherwise} \end{cases} \quad (2)$$

The PSU adjustment factor for extreme growth PSUs can become very large and can result in very large weights for these PSUs. A few large weights can result in a substantial increase in the variance of survey estimates. Truncating the PSU adjustment factor would dampen the increase in the variance of survey estimates. The PSU adjustment factors were truncated at the 99th percentile as the threshold (cut-off) value. This means the adjustment factors for PSUs with adjustment factors greater than the 99th percentile would be set equal to the 99th percentile. The truncated PSU adjustment factor for the i^{th} PSU is therefore defined as:

$$PSU_ADJ_i^t = \begin{cases} 99^{th}\ percentile, & \text{where } PSU_ADJ_i > 99^{th}\ percentile \\ PSU_ADJ_i, & \text{otherwise} \end{cases} \quad (3)$$

The PSU adjustments for the LCS 2014/15 ranged from 0.6 to 16, with the 99th percentile of the PSUs within the sample equal to 5. Appendix 1 shows the 29 PSUs that had PSU adjustment factors greater than the 99th percentile and thus were truncated.

Base Weight

The base weight (W_b) is defined as the product of the provincial ISR and the truncated PSU adjustment factor for the segmentation of informal PSUs and the sub-sampling for growth PSUs:

$$W_b = ISR_p \times PSU_ADJ_i^t \quad (4)$$

Adjusted Base Weights

Synthetic Weight Adjustment for Non-coverage

During the design stage, very small census EAs were excluded from the area sampling frame because these EAs are often very remote and sparsely populated, representing a relatively small portion of the population and so have very little effect on the survey estimates. It would be either very inefficient on the basis of cost consideration to include these EAs in the frame, or it may not be feasible to conduct field operations in these remote areas. Since the population in these EAs form part of the target population, excluding these EAs from the sampling frame introduces non-coverage on the sampling frame.

A synthetic weight adjustment factor to account for the contribution from the excluded population was applied to the base weights. The adjustment factor was calculated using the Census 2001 population counts within the geographic areas per province to reduce the risk of potential synthetic bias. Let N_G be the number of persons within the target population from the geographic area G within a province and N_G^f the corresponding number of persons within the sampling frame. Then the synthetic weight adjustment factor is given by:

$$Synth_Wgt_G = N_G / N_G^f \quad (5)$$

The values of the adjustment factors are fixed for the life of the Master Sample design and ranges from 1 to 1.04, with the average factor over the primary stratum equal to 1.0055.

Non-response Adjustments

The most common practice to account for unit non-response is to adjust the base weights based on the assumption that the respondent units represent both the respondent and non-respondent units (i.e. for the characteristics measured in the survey, the non-respondents are similar to the respondents). This is a reasonable assumption when non-response is small and therefore it is important that field operations continue to ensure that steps are taken to keep non-response to a minimum. The base weights of the non-respondents are then redistributed amongst the respondents. This is often done using a non-response adjustment factor that is applied to the base weight to produce a non-response adjusted weight. The non-response adjustment factor is usually defined as the ratio of the sum of the weights of all eligible units, i.e. respondent and non-respondent units, in the sample to the sum of the weights of the respondent units.

The adjustment for total non-response was computed at two levels of non-response: PSU non-response and household non-response.

PSU Non-response

The sampled PSUs can be classified into three response categories based on whether a DU sample was drawn from it, whether it contained or had the potential to have contained eligible DUs, and whether or not it contained a respondent household if and when it contained eligible DUs.

The PSUs from which a DU sample was drawn can be classified into the following categories:

- **Respondent:** A PSU that had at least one eligible DU with a respondent household (i.e. had at least one completed questionnaire within the PSU).
- **Non-respondent:** A PSU that had eligible DUs with no respondent households, but at least one non-respondent household (meaning no questionnaire was captured within this PSU, i.e. due to refusals, non-contacts or all completed questionnaires were lost or not captured).
- **Out-of-scope:** A PSU that had no eligible DUs, meaning that the sampled DUs had no in-scope household and/or were unoccupied, vacant, demolished, etc.

The PSUs with no sampled DUs can either be classified as:

- **Non-respondent:** A PSU that had potential or could have had potential eligible DUs but no sample was drawn. The reasons why no sample was drawn are the PSU listing was not available in time (not captured), the PSU listing was not completed either due to denied access to the PSU or hostile situation (political unrest) within the PSU, the PSU did not have sufficient DUs to draw the sample due to huge DU shrinkage as compared to the Census 2001 count, etc.
- **Out-of-scope:** A PSU that had no DUs – an empty/vacant PSU most likely because all DUs had been demolished.

Let p_h^r be the number of respondent PSUs from stratum h and p_h^{nr} the corresponding number of non-respondent PSUs. The PSU non-response adjustment factor at stratum level is then given by:

$$PSU_NR_ADJ_h = \frac{(p_h^r + p_h^{nr})}{p_h^r} \quad (6)$$

The LCS 2014/15 sample was based on the 2008 master sample of 3 080 PSUs. However, there were 40 PSUs with no DU sample, thus the sample of 30 818 DUs were selected from only 3 040 PSUs. Amongst the PSUs with no DU sample, 25 PSUs were non-respondent due to 19 PSUs not captured on the dwelling frame, and 6 PSUs having an insufficient DU count. The remaining 15 PSUs were vacant and therefore out-of-scope. Amongst the PSUs that had a DU sample, 2 974 PSUs were respondent, 50 PSUs were non-respondent and 16 PSUs were out-of-scope. Appendix 2 shows the PSUs that were classified as non-respondent or out-of-scope. As a result of the above classification, 52 strata had PSU non-response. The PSU non-response adjustment factors amongst these strata ranged from 1.067 to 4.

Household Non-response

The household records were assigned to one of three response categories, i.e. respondent, non-respondent or out-of-scope as described in Section 2.1 above. Since out-of-scope household records do not contribute to the survey estimates, only the eligible household records (respondent and non-respondent) were used in computing the household non-response adjustment.

In general, the household non-response adjustment was computed at the PSU level. However, in those cases where the non-response at PSU level was large, meaning an adjustment factor of greater than or equal to 1.5, the non-response adjustment was computed at the variance unit (VarUnit) level (as defined in Section 4 below) for all PSUs within the VarUnits containing the cases with high non-response. Let n_{hvi} be the weighted number of eligible households in the dwelling sample from PSU i in the variance unit v within the design stratum h and n_{hvi}^r be the weighted number of respondent households out of the n_{hvi} eligible households. The remaining $n_{hvi} - n_{hvi}^r$ households are then the weighted non-respondent households. The household non-response adjustment factor is then given by:

$$HH_NR_ADJ_{hvi} = \begin{cases} \frac{n_{hvi}}{n_{hvi}^r}, & \text{for PSUs within VarUnits with all adjustments} < 1.5 \\ \frac{\sum_{hv} n_{hvi}}{\sum_{hv} n_{hvi}^r}, & \text{for PSUs within VarUnits with at least 1 adjustment} \geq 1.5 \end{cases} \quad (7)$$

For LCS 2014/15, there were 503 PSUs (see Appendix 3) that had household non-response adjustment factors greater or equal to 1.5 at the PSU level, with the maximum adjustment factor equal to 11. The non-response adjustment factors for all PSUs within the VarUnits containing these cases were therefore computed at the VarUnit level. The final household non-

response adjustment factors ranged from 1.03 to 5.04, with 427 PSUs remaining with adjustment factors greater or equal to 1.5, even at the VarUnit level.

Adjusted Base Weight

The adjusted base weight (W_a) is defined as the product of the base weight (W_b) and the three adjustment factors discussed above, i.e. synthetic weight adjustment factor for non-coverage, PSU non-response adjustment factor and household non-response adjustment factor.

$$W_a = W_b \times Synth_Wgt_H \times PSU_NR_ADJ_h \times HH_NR_ADJ_{hvi} \quad (8)$$

Trimmed Adjusted Base Weight

Extremely large weights, even if affecting only a small portion of sampled cases, can result in a substantial increase in the variance of survey estimates. Therefore, it is common practice to trim extreme weights to some maximum value, in order to limit the associated variation in the weights (thereby reducing the variance of survey estimates), and at the same time prevent a small number of sampled units from dominating the overall estimates. Weight trimming is most frequently used after the adjustment of weights for non-response.

Therefore, once the base weights had been calculated and adjusted to account for the imperfections discussed above, the distribution of the adjusted base weights were examined for possible extreme weights and were trimmed at the 99th percentile as the maximum cut-off value, meaning that if the adjusted base weight for the sampled units were greater than the 99th percentile, the adjusted base weight for these cases was set equal to the 99th percentile. The trimmed adjusted base weight (W_t) is defined as:

$$W_t = \begin{cases} 99^{th} \text{ percentile} , & \text{where } W_a > 99^{th} \text{ percentile} \\ W_a , & \text{otherwise} \end{cases} \quad (9)$$

Error! Reference source not found. below shows the distribution of the adjusted base weights for LCS 2014/15. The adjusted base weights ranged from 115.43 to 6933.54, with the 99th percentile over the sampled households equal to 1864.01. A total of 231 (0,99%) households had an adjusted base weight greater than the 99th percentile and thus were set equal to 1864.01 (see Appendix 4).

Calibrated Weights

In the final step of constructing the respective sample weights, all individuals within a household were assigned the same adjusted base weight. The trimmed adjusted base weights were calibrated such that the respective aggregate totals matched with independently derived (by Stats SA Demography Division) population estimates for various age, race and gender groups at national and provincial levels. The calibrated weights were constructed using the StatMx software from Statistics Canada, with a lower bound on the calibrated weights set at 50. The calibrated weights are constrained such that each individual within the same household has the same calibrated weight; this was achieved through the integrated household weighting approach.

The population estimates used for the calibration of the trimmed adjusted base weights in constructing the sample weights for LCS 2014/15 was the mid-April population estimate for 2015 based on the 2015 mid-year series. The population estimates were used in benchmarking the survey estimates to two sets of control totals:

- National level totals were defined by the cross-classification of age, race and gender. Age represents the 16 five-year age groups of 0–4, 5–9, 10–14, 15–19, 20–24, 25–29, 30–34, 35–39, 40–44, 45–49, 50–54, 55–59, 60–64, 65–69, 70–74 and 75+. Race represents the four groups of black African/, coloured, Indian/Asian and white. Gender represents the two groups of male and female. The cross-classification resulted in 128 calibration cells at the national level (see Appendix 5).
- Provincial level totals were defined by four broad age groups. The four age groups used are 0–14, 15–34, 35–64, and 65+. The four age groups across the nine provinces results in 36 calibration cells (see Appendix 6).

Final Sample Weight

The final sample weights (W_s^P) are defined as the product of the trimmed adjusted base weight (W_t) and the calibration factor ($Cal_Factor_j^P$) calculated during the calibration process within StatMx for benchmarking the trimmed adjusted base weights to the population estimates.

$$W_s^P = W_t \times Cal_Factor_j^P \quad (10)$$

Error! Reference source not found. below shows the distribution of the final sample weights for LCS 2014/15. The sample weights ranged from 50.00 to 5739.8918, aggregating to the estimated population of 54 767 427.25.

THE DATA FILES

The files and their contents are as follows:

LCS2015_households: Households' characteristics (Sections 1, 5–20, 23)

LCS2015_households_assets: Assets acquired by households (Section 6.9)

LCS2015_persons_final: Particulars on each person in a household (Sections 1–4, 25)

LCS2015_personincome: Individual income (Section 24)

MERGING THE FILES

The unique number is common in all the files and can therefore be used to merge files.

THE CODE LISTS

Data file name: LCS2015_COICOP

COICOP: The Classification of Individual Consumption by Purpose (COICOP):

This file provides the link between the COICOP codes allocated to an item and the description of the item. The classification is hierarchical and presented in four levels, i.e. main expenditure group level, secondary expenditure group level, and third expenditure group level and at detailed level. The expenditure files in the LCS 2014/2015 data set link amounts to COICOP codes. This file can be merged with the different datasets in order to obtain the descriptions for the different hierarchies of the COICOP codes. This can be done by merging the COICOP file with the expenditure/income file using the COICOP code as the common variable.

THE WEIGHT FILE

Data file names: LCS2015_HHLD_HEADS_CAL_ABWGT and

LCS2015_PERS_CAL_ABWGT

These files provide weights (household headship weighting and integrated weighting) used to raise LCS data to the universe. All data files provided have been merged with these data files to include the weight variable (hholds_wgt for household files and cal_abwgt for person files).

Description of variables

The description of the variable comprises the following information:

Descriptive name: This is a short English description plus the variable name in the original file used by Stats SA to construct the ASCII/TEXT file.

Explanation: This is a further explanation of the variable or, for derived variables, the method of derivation.

Missing value: A code for “missing”/unspecified values is given for each variable. For expenditure and income, missing value is not coded.

Not applicable: The code for not applicable is provided for each variable. These are now numeric. For expenditure and income, not applicable value is not coded.

Notes: Specific observations to be noted by users.

Position of the variable: The position of the data within the record, recorded in the format (@xxx y). “@xxx” indicates that the data begin at position (i.e. column) xxx and “y” indicates that it is y digits wide.

Valid range: The range of valid values for the variable. For continuous variables, this reflects the upper and lower limits as found in the data.

Some of the questions in the Living Conditions Survey questionnaire are pre-coded, i.e. there are a set number of choices from which one or more must be selected. For open-ended ‘write-in’ questions, the description will note that post-coding occurred and explain how this was done. For most variables the coding is apparent from the questionnaire (available elsewhere in the documentation). Where the coding is not apparent, the description either provides the codes or indicates where code lists are to be found.

General notes to users

Missing values for money metric variables were assigned zero values for systems compatibility.

LCS2015_households: Household information

Unique number (UQNO)

(@1 18.)

This is a unique identifier of a household. The UQNO is an 18-digit number, which is made up of a primary sampling unit (PSU) number (11 digits), dwelling units (DU) number (5 digits), and household (Hh) number (2 digits):

Example:

PSU number = 10100022000

DU number = 00033

Hh number = 01

The PSU, DU and Hh numbers can be derived from the UQNO.

Valid range: 101000220000003301–986010560000020801

Survey date (SURVEYDATE)

(@19 7.)

The month and year in which the household is surveyed.

Note to users

The LCS was conducted for a period of one year, from October 2014 to October 2015.

Valid values:

4102014–4102015

1.1c	1. During the 12 months prior to the survey period, is there any other person(s) who has/have been part of this household for at least 6 months? 1 = YES 2 = No 2. Age of head of household (Ageofhead)

(@356 3.)

Valid range: 13–103

Household size (hhsiz)

(@359 2.)

Valid range: 1–27

Household expenditure (expenditure)

(@361 12.)

Note to users

This is the value of expenditures incurred by households for 12 months inflated/deflated to April 2015 using CPI.

Valid range: R1 445–R2 601 670,9727

Household income (income) (@373 12.)

Note to users

This is the household income receipts for 12 months inflated/deflated to April 2015 using CPI.

Valid range: R0–R7 943 236,7949

Expenditure per capita (expenditure_pcp) (@385 12.)

Note to users

This is the value of expenditures incurred by households for 12 months inflated/deflated to April 2015 using CPI divided by the number of individuals that are part of the household.

Valid range: R454–R1 307 695,5919

Income per capita (income_pcp) (@397 12.)

Note to users

This is the household income receipts for 12 months inflated/deflated to April 2015 using CPI divided by the number of individuals that are part of the household.

Valid range: R0–R3 173 125,3195

Expenditure in-kind (expenditure_inkind) (@409 12.)

Note to users

This is the value of expenditures including in kind expenditure incurred by households for 12 months inflated/deflated to April 2015 using CPI.

Valid range: R1 445–R2 637 938,1876

Household income in-kind (income_inkind) (@421 12.)

Note to users

This is the household income including income in kind receipts for 12 months inflated/deflated to April 2015 using CPI.

Valid range: R119–R7 943 236,7949

Expenditure decile (expenditure_decile) (@433 2.)

Derived variable (see Appendix A for the cut-off values)

Note to users

Expenditure deciles are constructed by ranking the expenditure by order of magnitude (low to high) and dividing the distribution into groups of 10, with decile 1 representing the lowest decile and decile 10 representing the highest decile.

Valid range: 1–10

Expenditure quintile (expenditure_quintile) (@435 1.)

Derived variable (see Appendix A for the cut-off values)

Note to users

Expenditure quintiles are constructed by ranking the expenditure by order of magnitude (low to high) and dividing the distribution into groups of 20, with quintile 1 representing the lowest quintile and quintile 5 representing the highest quintile.

Valid range: 1–5

Expenditure per capita decile (expenditure_pcp_decile) (@436 2.)

Derived variable (see Appendix A for the cut-off values)

Note to users

Expenditure per capita deciles are constructed by ranking the per capita expenditure by order of magnitude (low to high) and dividing the distribution into groups of 10, with decile 1 representing the lowest decile and decile 10 representing the highest decile.

Valid range: 1–10

Expenditure per capita quintile (expenditure_pcp_quintile) (@438 1.)

Derived variable (see Appendix A for the cut-off values)

Note to users

Expenditure per capita quintiles are constructed by ranking the per capita expenditure by order of magnitude (low to high) and dividing the distribution into groups of 20, with quintile 1 representing the lowest quintile and quintile 5 representing the highest quintile.

Valid range: 1–5

Income decile (income_decile) (@439 2.)

Derived variable (see Appendix A for the cut-off values)

Note to users

Income decile is constructed by ranking household income by order of magnitude (low to high) and dividing the distribution into groups of 10, with decile 1 representing the lowest decile and decile 10 representing the highest decile.

Valid range: 1–10

Income quintile (income_quintile) (@441 1.)

Derived variable (see Appendix A for the cut-off values)

Note to users

Income quintile is constructed by ranking household income by order of magnitude (low to high) and dividing the distribution into groups of 10, with decile 1 representing the lowest decile and decile 10 representing the highest decile.

Valid range: 1–5

Income per capita decile (income_pcp_decile) (@442 2.)

Derived variable (see Appendix A for the cut-off values)

Note to users

Income per capita deciles are constructed by ranking household per capita income by order of magnitude (low to high) and dividing the distribution into groups of 10, with decile 1 representing the lowest decile and decile 10 representing the highest decile.

Valid range: 1–10

Income per capita quintile (income_pcp_quintile) (@444 1.)

Derived variable (see Appendix A for the cut-off values)

Note to users

Income per capita quintiles are constructed by ranking household per capita income by order of magnitude (low to high) and dividing the distribution into groups of 20, with quintile 1 representing the lowest quintile and quintile 5 representing the highest quintile.

Valid range: 1–5

Expenditure in kind decile (expend_inkind_decile) (@445 2.)

Derived variable (see Appendix A for the cut-off values)

Note to users

Expenditure in kind deciles are constructed by ranking expenditure in kind by order of magnitude (lowest to highest) and dividing the distribution into groups of 10, with decile 1 representing the lowest decile and decile 10 representing the highest decile.

Valid range: 1–10

Expenditure in kind quintile (expend_inkind_quintile) (@447 1.)

Derived variable (see Appendix A for the cut-off values)

Note to users

Expenditure quintiles are constructed by ranking expenditure in kind by order of magnitude (lowest to highest) and in kind dividing the distribution into groups of 20, with quintile 1 representing the lowest quintile and quintile 5 representing the highest quintile.

Derived variable (see Appendix A for the cut off values)

Valid range: 1–5

Income in kind decile (income_inkind_decile) (@448 2.)

Derived variable (see Appendix A for the cut-off values)

Note to users

Income in kind deciles are constructed by ranking income in kind by order of magnitude (lowest to highest) and dividing the distribution into groups of 10, with decile 1 representing the lowest decile and decile 10 representing the highest decile.

Valid range: 1–10

Income in kind quintile (income_inkind_quintile) (@450 1.)

Derived variable (see Appendix A for the cut-off values)

Note to users

Income in kind quintiles are constructed by ranking income in kind by order of magnitude (lowest to highest) and dividing the distribution into groups of 20, with quintile 1 representing the lowest quintile and quintile 5 representing the highest quintile.

Valid range: 1–5

35. Wheelbarrow.....	1	2	3
36. Bed (base set and mattress).....	1	2	3

If owns, how many beds?

[illegible]

LCS2015_Household_assets: Household assets information

Unique Number (UQNO) (@1 18.)

This is a unique identifier of a household. The UQNo is an 18-digit number, which is made up of a primary sampling unit (PSU) number (11 digits), dwelling units (DU) number (5 digits) and household (Hh) number (2 digits).

Example:

PSU number = 10100022000

DU number = 00033

Hh number = 01

The PSU, DU and Hh numbers can be derived from the UQNo.

Valid range: 101000220000003301–986010560000020801

Survey date (SURVEYDATE) (@19 7.)

The month and year in which household is surveyed.

Note to users

The LCS was conducted for a period of one year, from October 2014 to October 2015.

Valid range: 4102014–4102015

6.9.1 01 Ownership or access to radio (Q69101RADIO) (@26 1.)

LCS2015_Persons_final: Persons information

Unique Number (UQNO)

(@1 18.)

This is a unique identifier of a household. The UQNO is an 18-digit number, which is made up of a primary sampling unit (PSU) number (11 digits), dwelling units (DU) number (5 digits) and household (Hh) number (2 digits):

Example:

PSU number = 10100022000

DU number = 00033

Hh number = 01

The PSU, DU and Hh numbers can be derived from the UQNO.

Valid range: 101000220000003301–986010560000020801

Survey date (SURVEYDATE)

(@19 7.)

The month and year in which the household is surveyed.

Note to users

The LCS was conducted for a period of one year, from October 2014 to October 2015.

Valid values: 4102014–4102015

Person number (PERSONNO)

(@26 2.)

Valid range: 01–27

1.2 Sex of each household member (Q12SEX)

(@28 1.)

1.2	Is a male or a female? 1 = MALE 2 = FEMALE
-----	--

Universe

All household members who usually reside in the household at least four nights a week, including babies, the bedridden and the elderly persons. All members of a household who live together and provide themselves jointly with food or other essentials for living, or a single person living alone.

Note to users

This question is asked for all household members, to determine their sex. The enumerators were instructed not to assume the sex of household members by just looking at people's names or physical appearances. They were instructed to ask the respondent the sex of each member of the household without any assumptions.

Final code list

1 = Male

2 = Female

(@29 1.)

1.3	<p>How would describe him/herself in terms of population group?</p> <p>1 = BLACK AFRICAN</p> <p>2 = COLOURED</p> <p>3 = INDIAN/ASIAN</p> <p>4 = WHITE</p> <p>5 = OTHER, <i>specify</i></p>
-----	---

All household members in the selected dwelling units.

This question was asked to determine the population group of all persons. The field workers were instructed to ask the question for each member of the household and not to make any assumptions or conclusions, which may be influenced by his/her observation based on people's names during the interview. This question may seem very sensitive to some respondents, especially in this post-apartheid era, but it is important to find out the composition of the South African population.

1.18	<p><i>Ask if more than one source is given in Q1.17.</i></p> <p>Which is’s main source of income, i.e. the one which brings in the most income to the person?</p> <p><i>Give the response category number from Q1.17.</i></p>
------	--

Universe

All household members in the selected dwelling units.

Note to users

This question was asked to determine the main source of income, especially if the respondent indicated more than one source in Question 1.17. If the respondent, for example, reported 'yes' to response '01' and 'yes' to '09' in Question 1.17, and was asked to indicate the main source, he/she will record '01' in the questionnaire if it is the source that bring the most income for him/her. The question was asked to all respondents who reported a source of income, even if they had one source.

Final code list

- 01 = Salaries and wages
