1. Introduction

The Victims of Crime Survey (VOCS) is a countrywide household-based survey that examines crime from the point of view of the victim. While surveys of crime victims cannot replace police statistics, they can provide a rich source of information that will assist in the planning of crime prevention. The survey is conducted annually in all nine provinces and the data is used for the development of policies and strategies, as well as crime prevention and public education programmes. Victims of crime surveys are recognised as a tool that helps governments and the public to understand their crime problems and how better to address them.

A victims of crime survey can also examine the extent of reporting of crime, explore the perceptions that different people have about the police and police service, and act as a benchmark against which future surveys of the same nature can be compared.

The VOCS has been well established in South Africa (SA) and internationally. There is an international initiative that has supported and initiated victim surveys in many developing and developed countries, known as the International Crime Victim Survey (ICVS). The ICVS is undertaken by the United Nations Interregional Crime and Justice Research Institute (UNICRI). A number of surveys on crime victims have been conducted in the recent past in South Africa. For example, the Institute for Security Studies (ISS) and the University of South Africa (UNISA) have conducted separate crime victimisation studies in Johannesburg. The Human Sciences Research Council (HSRC) has been conducting studies on crime for the past 20 years, but these do not focus specifically on victims.

2. Aim of the survey

The primary aim of the Victims of Crime Survey is to establish the prevalence of particular kinds of crime within a certain population. This may be victimisation experienced by individuals or households. Data from victimisation surveys can be used to supplement official police-recorded crime statistics. The objectives of the survey are to:

- Provide information about the dynamics of crime from the perspective of households and the victims of crime.
- Explore public perceptions of the activities of the police, prosecutors, courts and correctional services in the prevention of crime and victimisation.
- Provide complementary data on the level of crime within South Africa in addition to the statistics published annually by the South African Police Service (SAPS).

3. Target population

The target population of the survey consists of all private households in all nine provinces of South Africa, as well as residents in workers’ hostels. The survey does not cover other collective living quarters such as students’ hostels, old-age homes, hospitals, prisons and military barracks. It is only representative of non-institutionalised and non-military persons or households in South Africa.

4. Purpose of this document

This document provides sufficient information that will allow users to properly use and interpret statistical information, as well as understand the properties of data. To make sure that information is interpretable, this metadata will give descriptions of the underlying concepts, variables and classifications that have been used, and the method of data collection, processing and estimation used in the production of statistics.
5. Structure of the document

The VOCS 2017/18 data is presented in numerous files, which include flat files, ASCII, fixed field files, with one line of a given length per record. These formats make the data usable with as many statistical programs as possible, thus making it accessible to a wider range of users.

The files and the corresponding sections of the questionnaire are as follows:

Person file: Data from Flap and Section 1 (excluding Section 1.6)
Household file: Data from Section 1.6 and Sections 10–20
Individual file: Data from Sections 21–28

Since this metadata is mainly for the public use of microdata files, information in each file contains the following:

- Nature of records in the file and population covered
- Description of variables
- Questions
- Codelist

Description of variables

The description of the variables comprises the following information:

**Descriptive name**: This is a short English description plus the variable name in the original file used by Stats SA to construct the ASCII file.

**Position of the variable**: The position of the data within the record, recorded in the format (@xxx y.). '@xxx' indicates that the data begins at position (i.e. column) xxx and ‘y’ indicates that it is y digits wide. All data is numeric. All records with a given unique number belong to the same household.

**Source**: This is either the question in the questionnaire or, for derived variables, the method of derivation. Derived variables are usually found towards the end of a file.

**Valid range**: The range of valid values for the variable. For continuous variables, this reflects the upper and lower limits as found in the data.

**Not applicable**: A numeric code for ‘not applicable’ is provided for each variable.

**Missing value**: A code for ‘missing/unspecified’ values is given for each variable.

**Notes to user**: Specific observations to be noted by users.

**Linking files**: The data from different files can be linked on the basis of a record identifier. A unique number is the record identifier in the first field/s of each file and is unique to each record.
6. Accessibility of data

Users can access, explore and download the microdata in various formats, i.e. SAS, SPSS, Stata, etc. Users can also access the metadata from StatsOnline at www.statssa.gov.za.

Other important information is found:
• In the questionnaire
• In relevant publications
• On the website (www.statssa.gov.za)

7.2 Survey requirements and design

The questionnaire design, testing of the questionnaire, sampling techniques, data collection, computer programming, data capturing, and weighting constituted the research methodology used in this survey, and are discussed below.

7.3 Questionnaire design

Stats SA has committed itself to the highest international standards of data collection. In this regard, without compromising South African values and concepts, the VOCS 2017/18 strives to bring the questionnaire content to international standards, so that comparative analysis with other countries can be done. The VOCS 2017/18 questionnaire was developed based on the questionnaires used in the International Crime Victim Survey (ICVS) and previous VOCSs (both conducted by ISS and Stats SA), with modifications in some instances. The Stats SA questionnaire design standard for household surveys was also used as a normative reference. In order to minimise fieldworker and capturing errors, the questionnaire was mainly pre-coded. During the process of questionnaire design, workshops were held. Participants included representatives from various government departments, especially from the safety and security cluster, non-governmental organisations, researchers, and other stakeholders. The questionnaire was tested behind the glass and within selected households in Gauteng. Before finalisation, the draft version of the questionnaire was presented nationally and internationally to gain input.
Sections 21–28 of this questionnaire required that an individual be randomly selected from the household to respond to questions classified as individual crimes. The methodology used was to select a person 16 years or older, whose birthday was the first to follow the survey date.

Table 2 summarises the detail of the questions included in the VOCS questionnaire. The questions are covered in 28 sections, each focusing on a particular aspect.

## 7.4 Sample design

The sample design for the VOCS 2017/18 was based on a Master Sample (MS) originally designed for the Quarterly Labour Force Survey (QLFS) as a sampling frame. The MS is based on information collected during the 2001 Population Census conducted by Stats SA. The MS has been developed as a general-purpose household survey frame that can be used by all household-based surveys, irrespective of the sample size requirement of the survey. The VOCS 2017/18, like all other household-based surveys, uses an MS of primary sampling units (PSUs) which comprises census enumeration areas (EAs) that are drawn from across the country.

The sample for the VOCS 2017/18 used a stratified two-stage design with probability proportional to size (PPS) sampling of PSUs in the first stage, and sampling of dwelling units (DUs) with systematic sampling in the second stage. The sample was designed to be representative at provincial level. A self-weighting design at provincial level was used and MS stratification was divided into two levels. Primary stratification was defined by metropolitan and non-metropolitan geographic area type. During secondary stratification, the Census 2001 data was summarised at PSU level. The following variables were used for secondary stratification: household size, education, occupancy status, gender, industry and income.

A randomised probability proportional to size (RPPS) systematic sample of PSUs was drawn in each stratum, with the measure of size being the number of households in the PSU. A sample size of 3080 PSUs was selected. In each selected PSU, a systematic sample of dwelling units was drawn. The number of DUs selected per PSU varies from PSU to PSU and depends on the inverse sampling ratios (ISR) of each PSU. The sample size for the VOCS 2017/18 is approximately 30 000 dwelling units.

## 7.5 Data collection

Statistics South Africa is committed to meeting the highest ethical standards in its data collection processes. In addition to being bound to the Statistics Act (Act No. 6 of 1999), the VOCS, due to its sensitive nature, required additional measures to ensure that the integrity and well-being of the respondents are protected. The VOCS 2017/18 Survey Officer Training Manual deals with the important areas of ethical considerations. It addresses the protection of respondents by means of informed consent and the protection of privacy and confidentiality, as well as data dissemination standards in more detail.

## 7.6 Editing and imputation

All questionnaires were scanned, and the data was sent to the post-capture process for editing and imputation. Data was checked for valid range, logic and consistency. At each stage of checking, data was edited to ensure
consistency. Data editing is concerned with the identification and, if possible, the correction of erroneous or highly suspect survey data.

The focus of the editing process was on clearing skip violations and ensuring that each variable only contains valid values. Very few limits to valid values were set and data was largely released as it was received from the field.

When testing for skip violations and doing automated editing, the following are some of the general rules that were applied in cases where one question follows the filter question and the skip is violated:

- If the filter question had a missing value, the filter is allocated the value that corresponds with the subsequent question that had a valid value.
- If the values of the filter question and subsequent question(s) are inconsistent, the filter question’s value is set to missing and imputed using logical imputation. The imputed value is then once again tested against the skip rule. If the skip rule remains violated, the question subsequent to the filter question is dealt with by either setting it to missing and imputing, or if that fails, printing a message of edit failure for further investigation, decision-making and manual editing.
- If the filter question and the values of subsequent question values were inconsistent, a counter is set to see what proportion of the subsequent questions have been completed. In most cases the 50% rule was applied. If 50% of the subsequent questions have been completed, the filter question’s value is modified to correspond with the fact that the rest of the questions in the set were completed. If less than 50% of the subsequent questions in the set were completed, the value of the filter question is set to missing and imputed using either the hot-deck or nearest neighbour imputation techniques. The imputed value is then once again tested against the skip rule. If the skip rule remains violated, the questions in the set that follows the filter question are set to missing.

When dealing with internal inconsistencies, as much as possible was done using logical imputation, i.e. information from other questions is compared with the inconsistent information. If other evidence is found to back up either of the two inconsistent viewpoints, the inconsistency is resolved accordingly. If the internal consistency remains, the question subsequent to the filter question is dealt with by either setting it to missing and imputing its value, or printing a message of edit failure for further investigation, decision-making and manual editing.

7.7 Weighting

The sampling weights for the data collected from the sampled households are constructed in such a manner that the responses could be properly expanded to represent the entire civilian population of South Africa.

The design weights, which are the inverse sampling rate (ISR) for the province, are assigned to each of the households in a province. The design weights for the VOCS 2017/18 sample were obtained by applying three adjustments to the base-weights. The first adjustment was applied to account for informal and/or growth PSUs. The second adjustment was applied to account for the EAs with less than 25 households, and the third was the non-response adjustment. In addition, there were two types of non-response adjustments: PSU non-response adjustment and household non-response adjustment. The PSU non-response adjustment was applied at the stratum level, whereas the household non-response adjustment was applied at the PSU level.

7.8 Non-response adjustment

In general, editing (i.e. invalid or inconsistent responses) and imputation (i.e. blanks within the questionnaire) were used for item non-response. The eligible households in the sampled dwellings can be divided into two response
categories: respondents and non-respondents. Weight adjustment is applied to account for the non-respondent households (e.g. refusal, non-contact).

7.9 Final survey weights

The final survey weights were constructed by calibrating the adjusted non-response design weights to the known population estimates as control totals using the integrated household weighting method. The lower bound for the calibrated weights was set equal to 50 when computing the calibrated weights with the StatMx software (Statistics Canada software).

The VOCS 2017/18 sample will be weighted using the Population Estimates of mid-May 2015. The final weights were benchmarked to the known population estimates of 5-year age groups by population groups by gender at national level, and broad age groups at provincial level. The 5-year age groups are: 0–4, 5–9, 10–14, 15–19, 20–24, 25–29, 30–34, 35–39, 40–44, 45–49, 50–54, 55–59, 60–64, 65–69, 70–74, and 75 and older. The provincial level age groups are 0–14, 15–34, 35–64, and 65 years and older. The calibrated weights are constructed in such a way that all persons in a household would have the same final weight.

7.10 Estimation

The final survey weights are used to obtain the estimates for various domains of interest; for example, the victimisation level in South Africa, South Africans' perceptions of crime levels in the country, etc.

7.11 Reliability of the survey estimates

The survey estimates for questions related to perceptions of crime and the criminal justice system are reliable and provide good estimates at provincial level. However, statistics related to specific crimes should be analysed and used with caution. Crimes that are relatively rare, such as murder, resulted in very few cases in the database and subjecting these to too detailed analysis will provide unreliable results. The general rule of thumb is that, if the number of weighted cases in a cell are less than 10 000, the estimates should rather not be used. Alternatively, less than five unweighted cases per cell should also be regarded as too small to provide reliable estimates.

Specific categories of crime, such as sexual assault, were generally under-reported in this survey and it should not be regarded as an accurate source of sexual assault data. This is primarily due to the sensitive nature of these assaults, and in some cases, the possible presence of the perpetrator in the household that is being interviewed.

7.12 Comparability with previous surveys

Prior to 2017/18, VOCS respondents were asked about their crime-related experiences in the previous calendar year, but the VOCS changed to a Continuous Data Collection (CDC) method. In this data collection method, respondents were interviewed on a rolling basis over the course of a year and asked about crime experienced in the 12 months prior to the interview. As a result of this, the victimisation experiences reported by respondents interviewed in a period of 12 months relate to a broader span of 23 months.

The VOCS 2017/18 is comparable to the previous VOCSs in that several questions have remained unchanged over time. Where possible, it was generally indicated in the report.
7.13 Limitations of crime victimisation surveys

Victimisation surveys are likely to produce higher crime estimates than police-reported administrative data. This may be due to the fact that many crimes are not reported to the police. Victim surveys deal with incidents that may not necessarily match the legal definition of crime. Although data from crime victim surveys are likely to elicit better disclosure of criminal incidents than data from police records, they can also be subject to undercounting, as some victims may be reluctant to disclose information, particularly for incidents of a sensitive nature, such as sexual offences.

The accuracy of statistics is influenced by the ability of people to recall past victimisations. The longer the elapsed time period, the less likely it is that an incident will be recalled accurately. Surveys are also subject to sampling and non-sampling errors.

7.14 Differences between victim surveys and police-reported data

The most basic difference between the two types of crime measurement is the method of data collection. Police-reported statistics obtain data from police administrative records. In contrast, victim surveys collect personal information from individuals about their victimisation experiences through face-to-face interviews. The survey covers victims’ experiences of crime at microdata level, including the impact of the crime on victims.

Police-reported statistics normally collate information on all incidents reported to a variety of police stations. Victim surveys ask a sample of the population about their experience and, if well designed, this sample should be representative of the population as a whole. Although police statistics and victim surveys normally cover comparable geographic areas, if appropriately nationally representative, victim surveys may exclude some categories of victims, such as very young children or persons residing in institutions such as a prison, hospital, care centre or military barracks.

8. Definition of terms

**Arson** – unlawful and intentional damaging of an immovable structure which is suitable for human occupation or the storing of goods and which belongs to another, by setting fire to it with the intention to prejudice another.

**Assaults and threats of assault (including domestic violence)** – attacked, physically beaten or threatened by an attacker in a frightening way without the attacker taking anything from the victim.

**College for crooks** – a place where people learn how to become crooks/criminals or how to become even better crooks/criminals.

**Consumer fraud** – selling something to a person or delivering a service, cheating that person in terms of the quantity or quality of the goods/service. Also includes cases where someone provides misleading information and tricks a person into buying something or signing documents.

**Hijacking (of motor vehicle)** – unlawful and intentional forceful removal and appropriation of a motor vehicle from the occupant(s).

**Home robbery** – unlawful and intentional forceful removal and appropriation of tangible property from residential premises while there is someone at home.

**Housebreaking/burglary** – committed by a person who unlawfully and intentionally breaks into a building or similar structure, used for human habitation, and enters or penetrates it with part of his or her body, or with an instrument with which he or she intends to control something on the premises with the intention to commit a crime on the premises. The occupant of the dwelling is NOT at home at the time.
Imputation – a procedure for entering a value for a specific data item where the response is missing or unusable.

Individual crimes – affect a single person rather than an entire household, for example, when a camera is stolen.

Malicious damage to property – the unlawful and intentional damaging of property belonging to another.

Motor vehicle vandalism – deliberately damaging a vehicle or parts of a vehicle, such as a car, van, truck or pick-up, for example through scratching the paintwork.

Murder – unlawful and intentional killing of another human being.

Panga – large cutting knife with a broad blade.

Parole – release of prisoners from prison for a specific amount of time based on prisoners giving their word to keep to certain restrictions.

Perpetrator – person(s) who commits an illegal or criminal act.

Physical force – bodily power, strength, energy or might.

In the context of this survey, physical force (v) includes actions where the human body is used to compel/force someone to do something or to hurt or kill someone. It can include actions such as pushing, pressing, shoving, hitting, kicking, throttling, etc.

Property crime – crime where a person’s property was threatened but not the person, such as theft of property, burglary, etc.

Prosecutor/state advocate – legal specialist (lawyer/advocate) whose job it is to make a case on behalf of the State against someone accused of criminal behaviour.

Robbery involving force – involves taking something from a person by the use of force or the threat of force, for example, pointing a knife at someone.

Sexual offences (including sexual assault, rape and domestic sexual abuse) – refers to grabbing, touching someone’s private parts or sexually assaulting or raping someone. In terms of the Sexual Offences Act (Act No. 32 of 2007) section 5(1), a person (‘A’) who unlawfully and intentionally sexually violates a complainant (‘B’), without the consent of B, is guilty of the offence of sexual assault; (2) a person (‘A’) who unlawfully and intentionally inspires the belief in a complainant (‘B’) that B will be sexually violated is guilty of the offence of sexual assault.

Stick/club – a long bar or stick made of wood, plastic or other material and used as a weapon.

Vandalism – deliberate damage to property belonging to someone else.

Violent crime – crimes where a person was threatened, injured or killed are violent crimes. The crime could be committed using a threat of force, physical force or a weapon. These are crimes against a person and include robbery, assault, sexual assault/offences, murder, hijacking, etc.

Weapon – an object used to cause harm or death to human beings or other living creatures. Can include knives, guns, pangas and knobkerries, metal or wooden bars/rods, broken glass, rocks, bricks, etc.
