### NOTES

Version 1.0 of the General Household Survey 2003 was acquired from Statistics South Africa in 2004.

Version 1.1, of this dataset was released in 2010 and included the new weights for the GHS 2002-2008 series released at the same time as the GHS 2009 (6 May 2010). Reweighting was necessary because of the major revisions that the population estimates underwent after the release of the Community Survey 2007 results and updates to the estimates of the impact of HIV/Aids on demographic trends in South Africa.

Version 1.1 included new weights to reflect (a) the findings of the Community Survey 2007 and new HIV/AIDS and mortality data, and (b) the adjusted provincial boundaries that came into effect in December 2006.

Changes made to the GHS 2002-2008 datasets during the reweighting process included the following:

- 1) Missing values for the demographic variables age, sex or population group were imputed for all historical datasets.
- 2) The demographic estimates published in 2009 were used for benchmarking all the historical data and the house files were weighted independently of the person files using estimates of the number of households in South Africa.
- 3) Provincial boundary adjustments were made to the historical datasets to adjust the historical data to the December 2005 geographical boundaries.

Each of these is discussed in the report: "Reweighting of the GHS 2002-2008 data series"

Version 1.2 of the household file of the General Household Survey 2003 includes data for the variable "Q450Fiel", which was missing in version 1.1. In previous versions of this dataset, in the variable "Q450Orch" values for "Unspecified" and "Not applicable" were combined. These have been separated in this version of the dataset.

Version 1.3 of the dataset was downloaded from Statistics South Africa's website on the 27th of January 2015.

Version 1.3 includes the new weights released for the GHS 2002-2011 series released at the same time as the GHS 2012 (22 August 2013). Reweighting was necessary in order to maintain the comparability of population estimates used in the GHS based on figures provided by the 2013 mid-year population estimation model that incorporates the demographic findings of Census 2011.

Version 1.3 also includes the following variables which were missing in version 1.2:

"GeoType" - Geography Type

"metro" - Metro

Earlier versions of the GHS datasets 2002 to 2007 included a District Council variable. This is no longer available in the versions issued by Statistics SA with new weights. They caution that although the GHS 2005-2007 sample was designed to report at DC level, the data is not reliable at this level. The 2008 - 2013 sample was designed to report at Provincial and Metro level (not DC level). However, StatsSA did not take the absence population estimates at metro level into account when weighting the data and therefore this data is not reliable at Metro level. StatsSA's new master sample used from 2015

onwards will weight down to metro level and the data will be provided at that level.

## Overview

---

### ABSTRACT

The GHS is an annual household survey specifically designed to measure the living circumstances of South African households. The GHS collects data on education, employment, health, housing and household access to services.

### KIND OF DATA

Sample survey data [ssd]

### UNITS OF ANALYSIS

The units of analysis for the General Household Survey 2003 are individuals and households.

## Scope

---

### NOTES

The scope of the General Household Survey 2003 includes:

Household characteristics: Dwelling type, home ownership, access to water and sanitation facilities, access to services, transport, household assets, land ownership, agricultural production

Individuals' characteristics: demographic characteristics, relationship to household head, marital status, language, education, employment, income, health, disability, access to social services, mortality.

Women's characteristics: fertility

## Coverage

---

### GEOGRAPHIC COVERAGE

The scope of the General Household Survey 2003 was national coverage.

### GEOGRAPHIC UNIT

The lowest level of geographic aggregations covered by the General Household Survey 2003 is province. The variable "Stratum" stratifies the data by urban and non-urban categories for each province.

**UNIVERSE**

The survey covered all de jure household members (usual residents) of households in the nine provinces of South Africa and residents in workers' hostels. The survey does not cover collective living quarters such as students' hostels, old age homes, hospitals, prisons and military barracks.

# Sampling

## Sampling Procedure

---

For the GHS 2003 a multi-stage stratified sample was drawn using probability proportional to size principles.

The sample was drawn from the master sample, which Statistics South Africa uses to draw samples for its regular household surveys. The master sample is drawn from the database of enumeration areas (EAs) established during the demarcation phase of Census 1996. As part of the master sample, small EAs consisting of fewer than 100 households are combined with adjacent EAs to form primary sampling units (PSUs) of at least 100 households, to allow for repeated sampling of dwelling units within each PSU. The sampling procedure for the master sample involves explicit stratification by province and within each province, by urban and non-urban areas. Within each stratum, the sample was allocated disproportionately. A PPS sample of PSUs was drawn in each stratum, with the measure of size being the number of households in the PSU. Altogether approximately 3 000 PSUs were selected. In each selected PSU a systematic sample of ten dwelling units was drawn, thus, resulting in approximately 30 000 dwelling units. All households in the sampled dwelling units were enumerated. The master sample is divided into five independent clusters. In order to avoid respondent fatigue (the LFS is a rotating panel survey which is conducted twice yearly), the GHS sample uses a different cluster from the LFS clusters.

## Weighting

---

A two-stage theoretical weighting procedure was done on the GHS 2003. In the first stage primary sampling units (PSU) are selected with probability proportional to size (PPS) from the census population.

Because there were undercounts in some PSUs (because households could not be traced or because of refusals to answer), the weight of each such PSU was adjusted upwards by a factor of  $nHH/n^*HH$  where  $nHH$  was the number of households which should have been interviewed and  $n^*HH$  was the number of households actually reached. Then all household weights were adjusted upwards by a further factor equal to the estimated population at the time of the GHS 2003 survey divided by the 1996 Census population estimate, to account for population growth between the 1996 Census (from which the master sample was drawn) and the date of the survey. These doubly adjusted weights are reported as the household weights in the data set. The person weights are derived by further adjusting the household weights in order to reproduce the marginal totals of the estimated population at the time of the 2003 GHS by gender, population group, province and age group. A SAS macro called CALMAR was used for this purpose.

The population estimate was derived by a 'bottom up' (cohort-by-cohort) exponential extrapolation from the 1996 and 2001 censuses. Such an estimate is quite reliable for the total population and the gender, population group and provincial subtotals. It is less reliable for the age distribution. Improved population estimates will become available when Statistics South Africa completes its short-term population projection model. The weights in this and other surveys may be modified in the light of model estimates.

### Data revisions

In May 2010 Statistics SA revised the population model to produce mid-year population estimates during 2008 in the light of the findings of the Community Survey 2007 and new HIV/AIDS and mortality data. The new data have been used to adjust the benchmarking for all previous datasets. Weighting and benchmarking were also adjusted for the provincial boundaries

that came into effect in December 2006. The new weights mean that the data for the GHS 2002 to GHS 2009 are now comparable. The General Household Survey 2003 data files (version 1.2) contain the new weights.

As a result of new statistical programs used for weighting, which discards records with unspecified values for the benchmarking variables, namely age, sex and population group, it became necessary to impute missing values for these variables. A combination of logical and hot deck imputation methods were used to impute the demographic variables of the whole GHS series from 2002-2009.

A new weighting system was also introduced for the household files as part of the revision process. This was based on household estimates that were developed using the headship ratio methodology. The databases of Census 1996, Census 2001, Community Survey 2007 and the Labour Force Survey 2003, Labour Force Survey 2005, and Quarterly Labour Force (Quarter 3) of 2009 were used to analyse trends and develop models to predict the number of households for each year. The weighting system was based on tables for the expected distribution of household heads for specific age categories, per population group and province.

Missing values and unknown values were excluded from totals used as denominators for the calculation of percentages, unless otherwise specified. Frequency values have been rounded off to the nearest thousand. Population totals in all tables reflect the population and sub-populations as calculated with SAS and rounded off. This will not always correspond exactly with the sum of the preceding rows because all numbers are rounded off to the nearest thousand.

New weights were released for the GHS 2002-2011 on 22 August 2013. Reweighting was necessary in order to maintain the comparability of population estimates used in the GHS based on figures provided by the 2013 mid-year population estimation model that incorporates the demographic findings of Census 2011.

# Questionnaires

## Overview

---

The GHS 2003 questionnaire collected data on:

Household characteristics: Dwelling type, home ownership, access to water and sanitation facilities, access to services, transport, household assets, land ownership, agricultural production

Individuals' characteristics: demographic characteristics, relationship to household head, marital status, language, education, employment, income, health, disability, access to social services, mortality.

Women's characteristics: fertility
